

Signal converters, trip amplifiers and process meters

Catalogue 2016/2017

Let's connect.

Analogue signal conditioning

Weidmüller 

Dear Customers,

The PDF versions of our catalogues offer practical additional functions, helping you to find your way around our product range and simplifying the ordering process.

In addition to the catalogue, the PDF also contains:

- Internal page links
- Links to the online catalogue

Try it out for yourself. Click the order number to obtain more detailed information and close-up images via your web browser. The links in the PDF file also enable you to go directly to the next desired catalogue page.

Further Weidmüller product catalogues can be accessed by clicking the following:

Signal converters, trip amplifiers and process meters

Catalogue 4.1

Signal converters, trip amplifiers and process meters

Product overview – Analogue Signal Conditioning

Intrinsically safe signal conditioners for hazardous area applications

Signal converters in 6 mm width

Signal converters

Trip amplifier for monitoring AC/DC circuits

Indicators and configurable displays

Signal converters, trip amplifiers and process meters

Intrinsically safe signal converters – ACT20X

Page B.4

- Analogue and binary signal interfaces to Ex Zone 0 / Division 1
- FDT/DTM software configurable
- 2 channel modules in 22.5 mm housing

Signal converter, 6 mm – ACT20M

Page C.4

- Isolating and converting of temperature signals and DC signals (3-way isolation, supply isolators and passive isolators)
- Up to 2 channels with a width of 6 mm
- Power supply via the CH20M DIN rail bus

Signal converter and monitoring components, 6 mm – MCZ

Page C.30

- Signal converter in terminal format
- Passive isolator, temperature/frequency converter and threshold monitoring
- Simple wiring with pluggable cross-connection channels

Network-compatible signal converters

ACT20C

Page D.6

- Separation and conversion of current or voltage signals
- Limit value monitoring, diagnosis, monitoring via Ethernet networks
- PC configuration with FDT/DTM software

Signal converters and monitoring components – ACT20P

Page D.8

- Separation and conversion of temperature and DC signals (3-way isolation, supply isolators and passive isolators)
- Strain gauge transmitter for reading from load cells
- High levels of galvanic isolation and accuracy

Signal converters – WAVE

Page D.18

- Separation and conversion of temperature and DC signals (3-way isolation, supply isolators and passive isolators)
- A large selection of standard signal- and measurement isolating transformers
- High level of galvanic isolation

Interface converters

Page D.74

- RS232/ RS485/ TTY interface converter in WAVE housing
- RS232 connection with SUB-D connector
- Bi-direction communication enabled

Trip amplifiers for monitoring – WAVE

Page E.2

- Monitoring DC and AC currents and voltages
- Current/voltage ranges and switching points can be set manually.
- Pluggable units for monitoring current – on DIN rail base

Displays

Page F.2

- Large four-character LED display
- 1/8"-DIN-standard front-panel with IP 65 protection
- Integrated signal converter and trip amplifier

Configuration adapter

Page G.4

- USB interface adapter for configuring signal converters
- Compatible with ACT2OX, WAVE TTA and ITX+ modules
- Simple installation with plug-in connector

Markers and cross-connectors

Page G.12

- Suitable MultiCard markers for all modules
- Pluggable cross-connectors for WAVE, MCZ and MICROSERIES

Calibration device

Page G.14

- Measures and simulates voltage and current signals
- Adjustable continuous level and ramping functions
- Easy to adjust with buttons on front

Product overview – Analogue Signal Conditioning

Analogue Signal Conditioning**

Introduction	A.2
Quick select – Analogue Signal Conditioning	A.4

Analogue Signal Conditioning Qs and As

A Where are analogue conditioners used?

In all types of electronic industrial and marine measurement and control systems – for example in processes such as power plants, steelworks, water and waste plants, oil and gas production and chemical processing. In fact, wherever temperature, pressure, level, flow, weight, speed, etc., is measured and controlled as part of a continuous or batch production process. Such measurement parameters – after being accurately produced – must not be degraded on their way from the field to the control room, despite external influences from the atmosphere and installation. Conversion or changes to these signals requires electronics of the highest quality, which can also withstand wide ambient temperature changes, electro-magnetic interference, vibration, corrosive or hazardous conditions.

What functions do analogue conditioners provide?

One or more of the following:

- 1) Isolation of high level DC measurement and control signals. (Why do we need isolation? – see the notes that follow later in this catalogue.)
- 2) Conversion of high level signals, such as 0...5 V input to 4...20 mA output
- 3) Amplification, linearisation and transmission of low-level sensor inputs, such as millivolts from thermocouples, into high level DC outputs to enable transmission over distances 100 m or more.
- 4) Initiation of status indications and alarms by creating relay contact closure outputs from analogue inputs.

Why do we need separate analogue modules nowadays? Surely the control system (PLC or DCS) can perform the same functions?

- 1) Sometimes this is true, but look at where the cabling from the field devices (transmitters, sensors, valves and actuators) needs to go. It will usually go not just straight to the control system. Many signals are also passed to local indicators and alarms, and each will need isolating from the others.
- 2) Often sensors - like thermocouples for temperature – need isolating, converting and linearising locally to a standardised high level signal (e.g. 4...20 mA) for long distance transmission – instead of running expensive compensation cable to the control system.
- 3) Where the control system has no isolated analogue inputs, a separate isolator will often be needed.
- 4) Where the control system cannot provide power for the sensor / transmitter and it is convenient to do this from an isolating module.
- 5) Where a high integrity, dedicated display is required, separate from the control system display, and the input needs splitting.
- 6) Where local linearisation is needed for a plant operator – for example where a liquid volume indicator is needed for filling a bulk storage tank, but the measurement is level (level to volume conversion depends on the shape of the tank).
- 7) Where the control system only takes 4...20 mA analogue inputs and the sensors provide other less common ranges, such as 0...20 mV, 2...10 V, 0...10 kΩ, 0...1 mA, 4...12 kHz, 0...5 A AC etc
- 8) Where the control system needs to be protected from electrical noise pulses on its analogue inputs
- 9) Where expansion of the analogue inputs would mean an expensive new I/O board for the control system

How can I select the right product for my application?

- 1) Weidmüller has a formidable range of analogue conditioners, covering most application requirements, and our range is expanding. We also have some useful tools for selection and configuration.
- 2) If you cannot find a suitable product for your application, it doesn't mean we don't have one! Tell us your requirement, and if we can't provide a solution from our current range of products, there may be a customised version that we could create for you.

B

Intrinsically safe signal conditioners for hazardous area applications

ACT20X signal converters

The ACT20X is a completely new line of signal converter products for the Ex zone. These compact modules require only 11 mm per channel and take up very little space in the electrical cabinet. Weidmüller has specifically designed the ACT20X line for process automation applications in Ex and non-Ex zones. The 17 different variants can process all standard input signals (such as 2-wire, HART®, NAMUR-, RTD, thermocouple or DC signals) from Ex zone 0. They can also handle digital or analogue signals from Ex-zone field devices to the controller. The integrated relay output issues an alert in the event of a malfunction; this makes troubleshooting easier and reduces facility down times. The WI-Manager configuration software is based on FDT (Field Device Tool) technology. The software allows you to configure all ACT20X products with your PC so that they can be custom-fit to a wide variety of process applications. Weidmüller provides a device type manager (DTM) for the ACT20X modules that can be used in any FDT-based frame. The DTMs allow you to configure different devices quickly and accurately. They also enable you to analyse measurements and diagnostics data. The DTM can also be used to clearly identify the connected device. The FDT frame application "WI Manager" and the device-specific DTMs are available from Weidmüller free of charge. The ACT20X modules can be used in a temperature range from -20 °C to +60 °C without limitations. The modules can be installed in the safe zone or in the explosion risk area of Zone 2. The ACT20Xs always deliver a pure, interference-free signal

thanks to their accuracy, temperature stability and high insulation strength. They can easily be used around the globe since they already have all the necessary international approvals, including ATEX, IECEx, GOST and FM. The newest member of the ACT20X family is the ACT20X-HUI-SAO-LP. This offers an intrinsically safe input for 0/4 to 20 mA, 0 to 10 V, temperature and resistance signals, and separates the Ex zone from the safe zone. The narrow 12.5 mm module is supplied via the 4 to 20 mA output.

Features

- International approvals for Zone 0, 1 and 2 (IECEx, ATEX) and Class 1 Division 1 and 2 (FM)
- Analogue and binary signal interface to Zone 0/Div.1 for explosion-risk inputs and outputs
- All standard input signals (4 to 20 mA HART®, NAMUR-, RTD- or thermocouple signals) out of Ex zone 0, 1 or 2
- Two-channel type saves space in the electrical cabinet and reduces installation costs
- HART® transparent signal isolator
- Integrated alarm contact
- Configuration over FDT/DTM standard with the frame application "WI Manager"

B

ACT20X

ACT20X – intrinsic safety signal conditioners for hazardous areas

PC-configurable conditioners family for hazardous areas in the new Weidmüller electronics housing for installation in safe or hazardous areas.

B ACT20X meets the arduous requirements of the process industry where potentially explosive fluids are controlled. The range connects to sensors and actuators in the hazardous area, isolates their signals and limits the energy passed to them. On the input side ACT20X models can process d.c.,

temperature, Namur and volt-free contact signals. On the output side field devices in the Ex area are controlled via the ACT20X with analogue or digital signals. All ACT20X products are characterised by insulation, accuracy and high temperature stability.

The digital 2-channel versions with width of 22.5 mm are available with either transistor or relay output. Due to this high component density, the space requirements and installation costs are reduced accordingly.

Configuration via FDT

All modules can be quickly and conveniently configured with manufacturer-independent FDT/DTM software.

Worldwide application

Fulfils the strict standards and requirements of the process industry. Can be used worldwide due to international and local approvals ATEX, IECEx, CULUS, FM, GOST and DNV.

Intelligent connection system

Pluggable, coded, with release lever. The release lever simplifies maintenance and allows disconnection without damaging the cables.

Alarm function

No laborious troubleshooting. Alarm function integrated for cable or sensor errors. In case of failures, a diagnostic signal is sent to the control system.

Robust

Wide ambient temperature range from - 20 °C ... + 60 °C.

SIL certification according 61508

Available for safety functions, e.g. switching aggregates on/off, monitoring actuators or temperature/pressure.

	Universal measurement and signal isolator/converter
	NAMUR disconnect-switch amplifier
	Valve control component

Current supply isolator, HART® Transparent

The ACT20X-HAI-SAO current supply isolator is a HART®-protocol transparent signal isolator for analogue input signals from Ex zone 0. It provides an analogue signal for the safe zone on the output side. It is available in a single-channel or double-channel version.

Temperature transducer

The ACT20X-HTI-SAO temperature transducer processes temperature signals from PT100 sensors and thermocouples originating in the Ex zone. A current signal (mA) can also be connected as the input signal. The input is part of an intrinsically safe circuit (Zone 0). The isolated milliamp analogue output is the input to the receiver or controller in the safe area. It is available in a single-channel or double-channel version.

Pulse Isolator, with NPN transistor output.

The ACT20X-HDI-SDO isolating switching amplifier is a digital pulse signal isolator for Namur sensors or volt-free contacts from a Zone 0 hazardous area. A transistor (NPN) output is provided for the receiver or controller in the safe area. Single-channel or double-channel versions are also available.

MCZ-SERIES – Frequency signal converter	C.34
MCZ-SERIES – Threshold monitoring	C.35

Analogue signal converter in 6 mm width

The thinnest signal converter for isolating, converting and monitoring analogue signals

The signal converters and the signal separators in the product family ACT20M, MICROSERIES and the MCZ enables the user to integrate many signal channels within a compact space. In addition to galvanic separation, these products offer the conversion and conditioning of DC and

temperature signals (TC and RTD) to standard norm signals (e.g. 4...20 mA, 0...10 V). The pluggable cross-connections option for MAS/MAZ and MCZ ranges, or the Weidmüller rail bus option for the ACT20M ensure a quick installation.

ACT20M

MCZ-SERIES

ACT20M – a narrow 6 mm signal converter

The new dimension for converting and isolating – housed in a 6 mm width

The new ACT20M range combines innovative technologies with the highest levels of functionality in an electronics housing measuring just 6 mm in width. Up to two channels per module result in space savings in the electrical cabinet. The high electrical isolation of 2.5 kV and an accuracy of up to 0.05 % both help to ensure a high degree of process reliability.

The product line consists of Input Loop Powered, Output Loop Powered and Auxiliary Powered analog isolators and converters, including a universal input converter. The eight-connection housing allows additional functionality such as 2 channel ILP, 2 channel OLP isolation and signal splitting with input powering option. The configuration is carried out via DIP switches or the FDT/ DTM software. The ACT20M modules are supplied via direct wiring or a rail bus.

The DIP switch can be configured simply on the module

In the “ACT20M Tool” software, simply select the type of input and output, and set the DIP switch configuration as displayed.

Easy configuration

DIP switches on the side are used to configure the input and output parameters, as well as the response time.

High level of galvanic isolation

2.5 kV of electrical isolation (300 V rated voltage) ensures excellent process reliability.

Installation is simple and quick

The power supply is simply snapped onto the rail bus for fast and easy installation. The supply can be through any ACT20M module or a separate power-feed unit.

Approvals

Fulfils the strict standards and requirements of the process industry. Can be used worldwide due to international and local approvals ATEX, IECEx, CULUS, FM, GL and DNV.

CH20M rail bus

Quick and safe power supply through the DIN rail.

This customer-friendly infrastructure solution brings power, signals and data to the rail in a quick and reliable manner. The rail bus can replace the tedious individual wiring process with a flexible and uninterrupted system solution. As a result, the customer saves time and cost—especially if any module changes are needed later, as other adjacent modules are not disturbed. The uninterrupted system bus is securely integrated within the 35 mm standard mounting rail. Whether 7.5 mm or 15 mm high, the custom-fit rail profiles are easy to install on all TS 35 standard rails in accordance with DIN EN 60715.

The resistant gold-plated contacts ensure a permanent and reliable contact. The ACT20M modules are simply snapped onto the mounting rail and are automatically in contact with the DIN rail bus.

The supply of 24 V DC to the power rail can be from any one of the auxiliary powered ACT20M modules, when that module is itself externally supplied. This allows the rail to power up to 8 other modules (approximately 400 mA). For powering additional ACT20Ms, a separate Feed-In module can be used.

The ACT20-Feed-In-Basic provides a simple and compact (6 mm width) power supply interface to the rail, for supplying up to 2.5 A (up to 50 x ACT20M modules).

The ACT20-Feed-In-Pro is a more powerful 22.5 mm wide solution. This takes 2 external 24 V DC inputs, and via internal diodes provides a redundant supply to the rail, and an alarm output in the case of input failure.

Rail bus accessories**CH20M BUS-PROFIL TS35x7.5/1000**

Support section for bus circuit board

- Support section for TS 35 x 7.5
- Length: 250, 500 or 750 mm

Power-feed module for the CH20M DIN rail bus

4 A supply with backup supply and error analysis

The power-feed unit ACT20-FEED-IN-PRO-S supplies the devices on the CH20M DIN rail bus with 24 V DC. At the same time, the FEED-IN device reads the group error contact – optionally provided by the installed devices – from the CH20M rail bus and sends a message through the status relay to the external controller. Optionally, two power supplies can be connected as a primary and back-up, to create a redundant 24 V DC source. An installation in Zone 2 / Division 2 is also possible. Three LEDs show the status of the power supply and the error status.

The FEED-IN-PRO can supply a maximum of 4 A to feed up to 120 devices mounted on a CH20M rail bus. Quick identification of errors on the DIN rail bus is through the internal status relay. The FEED-IN-PRO device immediately recognises and displays when a power supply has failed. The supply is then switched automatically to the redundant power supply.

Weidmüller offers a compact and narrow 6 mm feed-in module as an alternative. This feeds the 24 V DC from its field terminals directly to the DIN rail bus. Up to 80 modules can be fed with a maximum available current of 2.5 A.

ACT20 power-feed module

- Distributes the supply onto the busbar
- Compatible with Weidmüller CH20 DIN rail bus
- Optional connection for backup supply
- Approved for use in Ex-Zone 2 /Div. 2
- Monitoring of the supply voltage
- Alarm alerts via the status relay

Signal converter in a terminal format

The MCZ-SERIES signal converters have a slim terminal design and convert, isolate and monitor analogue signals. They have five tension clamp connections. The open side of the housing can be closed using a standard cover plate accessory. The housing has a low height of just 6.3 cm. It also accommodates a cross-connector for reducing the wiring of multiple module's 24 V and 0 V connections. Two WS10/6 markers can be used for labelling. These are available in MultiCard format and can be printed using Weidmüller's professional printing system.

Security

Electrical isolation increases the safety of operations and reduces the risk of facility malfunctions.

Saves space in the electrical cabinet

High product density (modules only 6 mm wide) reduces space taken on the DIN rail.

Simple wiring

The power supply can easily be bridged from one module to the next using pluggable cross-connections.

	DC/DC passive disconnector
	PT100 /RTD signal converter
	Frequency signal converter
	Threshold monitoring

Input current loop feed

- Passive isolators for galvanic isolation of 0/4...20 mA standard signals.
- The component draws power from the measurement signal and requires no additional auxiliary power
- Low energy consumption, pick-up current of < 100 µA.

Signal converters

Weidmüller analogue conditioners and monitoring modules are offered in touch-safe IP 20 housings and with space-saving DIN mounting.

This product line includes: passive and active isolation amplifiers for analogue current and voltage signals; measurement isolators for measuring temperatures, resistances, frequencies, AC/DC currents and voltages; and universally-configurable signal isolating converters with integrated threshold monitoring.

Weidmüller wide product range covers all the functions for isolating, converting and monitoring analogue signals. These products can therefore be used in practically all industrial measurement applications to safeguard the basic functionality between field signals and post-processing systems. A comprehensive line of accessories is also available for the analogue signal converter product line. These include pluggable cross-connectors, markers, and configuration adapters for the software-programmable products.

Features

- Can handle a variety of measurements
- Standard analogue signals on the output side
- Configurable options
- Stand-alone, pluggable connection mechanism – screw or tension clamp
- Tool-free installation
- Minimal commissioning needed - often with no calibration.
- Minimal wiring effort – with pluggable ZQV 2.5N cross-connector
- Excellent functionality
- Clear type designations makes selection easy
- High level galvanic isolation
- International approvals

Your process requires the utmost attention

Our new ACT20C signal conditioners support you in achieving this

Many process parameters in your system are handled by your control system, which shows you the current status of your process. Even so, do you have a full overview of critical system states? And this at all times, at every location, and with the recent system history?

With the ACT20C, you receive accurate information on the status of the sensors, signal processing and cabling. Data can be called up and will depend on your individual communications infrastructure. This comprehensive overview allows you to accurately analyse errors and faults, and initiate targeted actions taken by system operators and maintenance personnel. By doing so, this technology contributes to ensuring reliable system operation.

ACT20C signal conditioner with Ethernet interface

Comprehensive process transparency is provided by the transfer of diagnostics information, signals and data

You would like more process transparency for your systems. We support you with signal conditioners that supply you with precise information via our Ethernet interface. Let's connect.

To be able to control systems and processes optimally, you require a constant flow of information on the current states of individual applications, devices and functions.

Our ACT20C signal conditioner not only monitors the signal conversion, but also communicates precise information on device status, signals and data directly to connected computer and control systems.

Our Ethernet interface enables an event-controlled transfer of diagnostics information, which in turn supports the elimination of faults in, for example, plant operation.

Universal signal conversion

Can be used in a multitude of applications thanks to customer and application specific defined conversion methods with just one single module.

Simple operation and configuration

Software supported configuration allows a fast application of settings and simple operation.

Simple remote access

Continuous monitoring of device and system functions, simple and affordable integration of existing Ethernet networks.

Detailed analysis and presentation of core process parameters

The ACT20C supplies key parameters and historical data, independent of the location

Thanks to the ACT20C, Weidmüller is now the first to offer a solution which supplies you with extensive diagnostic and status information without the need to deal with the complexity of field bus systems.

The isolating converters are based on the proven, robust technology of transferring analogue signals to the DCS system. Various signal sources and field devices can be connected to the input side of the isolating converters. As a result of this, the ACT20C can be configured for the user-defined processing of current, voltage and transmitter signals. Access is accomplished via a service interface on

the front panel or via the Ethernet, and performance is ensured through the manufacturer-independent FDT/DTM software platform. To work with this platform, Weidmüller provides the WI-Manager universal FDT frame application.

Data collected in the ACT20C is made available over the Ethernet via Modbus TCP. Depending on the communications infrastructure, you can make this data available to your SCADA system within your network, and you can also access it via the Internet from any location using an industrial Ethernet router.

Network-ready signal converter for DC voltage and current signals

Network-compatible signal converter with Ethernet

- Scalable current or voltage input
- Current or voltage output
- Limit-value monitoring with parameterisation options
- Diagnostics on device status, signals and line faults via Modbus
- PC configuration with FDT/DTM software, download link at www.weidmueller.com

Take a preventative approach to monitoring plants and processes

ACT20C gateway conveys precise status information on your devices

Diagnostic and status information that's as comprehensive as possible and comes from all areas of an automation solution goes a long way in helping to optimise process control.

D With the ACT20C gateway and the communication-capable signal converters, for the first time ever we can obtain process data from the signal conversion level – regardless of the automation solution selected. An Ethernet interface enables simple access to the desired information. The data obtained in the ACT20C gateway is provided via Modbus TCP or OPC, or can be displayed directly in an FDT frame application.

The flexibility of the ACT20C gateway makes it easy for you to optimise your processes. Depending on the communication infrastructure, you can make this data available throughout your entire network or pass it on to your SCADA or maintenance system. The data can even be used from any location over the Internet via an Industrial Ethernet router.

The Ethernet interface enables events-driven transmission of diagnostic information. So, for example, measurement data about the pumps, which is continuously collected throughout their service life, provides information about their performance and operational status.

Your special advantages:

More transparency in your process automation

For the first time ever, extensive diagnostic and status information (which you can call up via the Ethernet interface) is available to you at status conversion level.

All the process parameters at a glance

The status of devices, environmental conditions and functions is continually monitored over the Ethernet.

**Simple commissioning, fast maintenance**

The station concept with "Plug & Produce" and "Hot Swapping" makes installation and maintenance work faster and thus more efficient.

**Extensive diagnostics concept**

Support of fast and exact cause analysis according to NE107, NE43 and NE44.

**Clever software configuration**

The software configuration based on the FDT and FDT2 standards makes parameterisation, documentation and data backup easier.

Condition monitoring

Preventative maintenance strategies using automation-independent information about operating conditions and process data for connected devices.

**Multiple limit value monitoring**

The main alarm and auxiliary alarm permit precise identification of all alarm situations.

D

**Smart software configuration**

The software configuration based on the FDT and FDT2 standards makes parameterisation, documentation and data backup easier.

**High process reliability**

A galvanic four-way isolation and an impulse withstand voltage of 6.4 kV pursuant to IEC 61010-2-201 guarantee optimum fusing.

Gateway for ACT20C station

- Access to all data from the devices connected to an ACT20C station
- RJ45 port with Ethernet TCP/IP
- Configuration by means of the FDT/DTM standard
- Station management with "Plug & Produce" and "Hot Swapping"

CH20M rail bus

Quick and safe power supply through the DIN rail.

This customer-friendly infrastructure solution brings power, signals and data to the rail in a quick and reliable manner. The rail bus can replace the tedious individual wiring process with a flexible and uninterrupted system solution. As a result, the customer saves time and cost—especially if any module changes are needed later, as other adjacent modules are not disturbed. The uninterrupted system bus is securely integrated within the 35 mm standard mounting rail. Whether 7.5 mm or 15 mm high, the custom-fit rail profiles are easy to install on all TS 35 standard rails in accordance with DIN EN 60715.

The resistant gold-plated contacts ensure a permanent and reliable contact. The ACT20M modules are simply snapped onto the mounting rail and are automatically in contact with the DIN rail bus.

The supply of 24 V DC to the power rail can be from any one of the auxiliary powered ACT20M modules, when that module is itself externally supplied. This allows the rail to power up to 8 other modules (approximately 400 mA). For powering additional ACT20Ms, a separate Feed-In module can be used.

The ACT20-Feed-In-Basic provides a simple and compact (6 mm width) power supply interface to the rail, for supplying up to 2.5 A (up to 50 x ACT20M modules).

The ACT20-Feed-In-Pro is a more powerful 22.5 mm wide solution. This takes 2 external 24 V DC inputs, and via internal diodes provides a redundant supply to the rail, and an alarm output in the case of input failure.

Your systems work with analogue current signals

ACT20P signal converters efficiently tackle signal conditioning and isolation

Your systems and processes are controlled using analogue current signals. Our signal isolation converters are the reliable and efficient solution to signal conditioning and galvanic isolation of current signals.

Let's connect.

D

Temperature, pressure, weight or distance: your system's sensors pass on a wide range of analogue signals. During this process, undesirable transients may occur, causing faults and damaging your controls' inputs.

Our ACT20P signal converter delivers reliable protection of controls and remote I/O inputs against transients and voltage peaks. It also adapts a multitude of signal variants to standard signals, in addition to being space-saving and efficient.

Its properties make the ACT20P signal converter a low-cost universal solution to all tasks involving the analogue isolation and conversion of current signals.

Fault-free recording of measured data in water management

During the final step of water purification, quality values are checked. To this end, the signals emitted by the measurement devices are transferred over several hundred metres from the switching box on the last setting basin to the plant control room. There, they are recorded, analysed and stored. For a smooth measurement data recording process, our signal isolation converters filter out all of the faults and transients according to the latest provisions set forth in EN 61010.

Can be integrated in HART® communication
Signal converters are suitable for HART®, transparent communication.

Rapid device replacement
Practical release lever for simple removal of the female connector.

More space in the cabinet
Two channels measure a mere 12.5 mm wide.

Reliable connection

Individually customisable protection against mismatching.

Variants for different applications

The range of products is rounded off by the intrinsically safe ACT20X signal converter and the high-performance ACT20M signal converter, which is just 6 mm across.

**High process reliability**

Thanks to the high level of galvanic isolation amounting to 4 kV (600 V rated voltage), secure operation is guaranteed.

Flexible supply

The wide supply range from 24 V UC to 230 V UC opens up a diverse range of applications for the ACT20P Pro DCDC II.

Precise data recording

Measurement data is converted and transmitted with an accuracy level of 0.05 %.

Universal solution

Due to the multitude of adjustable measurement ranges from ± 300 V DC or ± 100 mA DC, the input range can be deployed in an extremely broad spectrum of applications.

Universal DC isolation amplifier

- Universally configurable input and output for voltage/current
- Active or passive output
- Universal voltage supply 24..230 V AC/DC
- 3-way isolation
- Convenient configuration on the device with DIP switches or by means of clear-text display + buttons, without reference source.

All-purpose inputs combined with output loop supply

ACT20 signal converters are equipped for diverse applications

When it comes to recording analogue measured values, compliance with safety regulations and maximum precision are basic prerequisites for industrial plants. Basic security functions, such as switching units on and off, monitoring actuators or controlling temperature and pressure, require the support of high-precision signal converters.

With our ACT20X and ACT20P products, we are providing you with universal devices that will reliably isolate and convert signals from intrinsically safe or safe zones. Thanks to the integrated output current loop, the modules do not require any additional external power supply and can also be easily used in remote control boxes. Integrated in an enclosure that measures a mere 12.5 mm wide, the signal converters take up very little space on the DIN rail.

The latest addition to our ACT20X series is characterised by high precision and compliance with all the safety requirements for use in Ex zones 0, 1 and 2. Also, the ACT20P ITX+ offers extended input properties, such as measurement of +/-300 V AC/DC voltages and currents of up to +/-5 A DC. It even features a digital output for indicating limit values.

The great advantage of a signal converter in applications involving direct, on-site recording of measured values from temperature and pressure sensors is that it can be used independently of the power supply

Your special advantages:

Predestined for field use

The combination of all-purpose input and output loop supply makes the ACT20X a unique product solution for the process industry and plant manufacture. But the advantages of this solution really do come into their own especially when the device is used e.g. in remote cabinets in the mining industry – both above and below ground – or in overburden materials handling.

Universal converter with digital output

- Independent of external supply thanks to output loop-powered supply
- All-purpose usage thanks to versatile input functions
- Simple software configuration
- Digital output for versatile limit value setting

Limit monitoring with simple configuration

ACT20P identifies even the smallest deviations

Reliable monitoring of parameters such as pressure, flow and temperature plays an important role, especially for power applications and in the process industry. In this regard, individual specifications and standards define the limits to be observed for smooth process flows.

Our ACT20P trip amplifier enables a precise monitoring solution to be set up for your process signals. Easily configured via FDT/DTM software or also directly on the device, the universal module can be used in many ways. The universal input range as well as the robust design support a wide temperature range.

The trip amplifier is characterised by high reproducibility and reliability. Thanks to its wide range of alarm functions, it can identify and accurately report even the smallest deviations.

Effective control of threshold limits for the process industry - our trip amplifiers offer an especially precise solution that responds rapidly and correctly in the event of deviations

Your special advantages:

Simple configuration

Use the buttons on the 7-segment display to configure the ACT20P monitoring module extremely quickly. The manufacturer-independent FDT/DTM software also facilitates configuration.

Universal input

The universal input range covers DC currents up to 5 A and voltages up to 300 V, 2/3-wire RTD, thermocouples, resistors and potentiometers to 500 k Ω .

**Configured directly at the device**

A 7-segment display and LEDs support the direct configuration by push buttons and potentiometer.

**Numerous alarm functions**

Window alarm, alarm delay, wireline break detection and hysteresis are just some of the features with which the trip amplifier provides the best conditions for each process requirement.

**High temperature stability**

Thanks to the extended temperature range from -20 °C to +70 °C, the robust monitoring module can be used in any environment.

Universal limit-value monitoring

- Universally configurable input for temperature, voltage, current, potentiometer, resistance
- 2 independent relay outputs with multiple limit value functions: window alarm, upper/lower limits, hysteresis, delay, etc.
- Configuration on the device from 7-segment display or via FDT/DTM software
- External power supply 9...60 V DC

Note

CBX200 USB configuration adapter - 8978580000

Simple and quick configuration

DIP switches and potentiometers are located on the front, which means they're quickly accessible even when installed.

**Precise measured values**

The real-value effective procedure allows you to record the connected load's real power consumption, so you can reliably identify when levels exceed or fall below the nominal current.

**Easy to install**

The asymmetrical cable bushing makes it easier to feed through the power cable and permits precise measurement on an extremely small space.

**High process reliability**

Reliable function thanks to a galvanic four-way isolation and an impulse withstand voltage of 6.4 kV according to IEC 61010-2-201

6.4 kV

Current-measuring transducer

- Measuring and monitoring of AC/DC current
- Input/output electrically isolated
- Input and output ranges are adjustable

ACT20P Strain gauge transmitter

The ACT20P Bridge converts load cell/strain gauge measurement signals to standard analogue signals.

The ACT20P family offers the customer precise and functional signal converters in a compact design. The ACT20P Bridge is the first product from this new line of signal converters.

Load cells, with integral strain gauges, are used for weighing and load measurements throughout factory and process automation, in such applications as batch and recipe control, silo contents for granular products, bag weighing, engine strain measurements, and tank level.

The strain gauges, within the load cell, are film resistors in a measurement bridge network, which deform with load changes and create a varying millivolt output from the bridge. The ACT20P Bridge reads these signals and converts them to a standard signal 0(4) – 20 mA or 0 – 10 V.

The high input to output isolation provided protects the control PLC against signal line interference. A digital input representing the “empty” condition of the container (tare function) is a standard feature which zeroes the output of the ACT20P Bridge.

Features

- Adjust to load cells using push button
- Easy tare function using the integrated control input
- Intelligent pluggable connection method
The release lever simplifies maintenance and enables the connection to be unplugged without any wire damage.
- Integrated captive coding with the unique “auto-set” function

Exact measurement

The input with 6-conductor connection and very high accuracy (0.05 % of the measurement range) enables precise signal processing.

Conversion

Conversion of the bridge voltage in standardised analogue signals.

Tare calibration

Simple calibration of the empty (tare) weight can be done on-site by using the button under the front plate or with an external connection via a PLC output.

On-site calibration

Simple and reliable calibration on-site. The ACT20P Bridge is adjusted to the different load cells by means of a push button behind the hinged panel.

Protection

Protection against noise from the field. The 3-way isolation separates the input, the voltage supply and the output with 5.7 kV isolation voltage.

Strain gauge transmitter

ACT20P Bridge measuring transducer

Bridge measuring transducer for reading from load cells

General

The ACT20P Bridge is a DIN rail mounted, signal conditioner for industrial measuring bridges. It provides a precise excitation voltage for the bridge, and converts the input measurement to an isolated current/voltage signal. Bridge measuring transducers are used for various measurements like weight, force, tension, pressure, torque, and deflection.

Bridge excitation supply

Voltage sense connections are provided so that the excitation voltage can be measured at the bridge. Known as 'remote sensing' this method compensates for cabling and contact resistance errors. It is recommended for all new installations or where an upgrade is possible. Remote sensing wiring requires three twisted pairs.

TARE adjustment

The installed strain gauge is normally subjected to an initial load independent of the measurement taken. The TARE connection allows you to correct for this initial loading by operating a switch. Alternatively there is a button on the front of the unit (under the front cover) that performs the same function. Press for two seconds to correct for the initial load (the 'CAL HI' LED will light for one second).

Gauge factor

Every strain gauge has a 'gauge factor' which gives the output voltage at full-scale for a one volt excitation voltage (given in mV/V). You multiply this by the bridge excitation voltage to get the output voltage when the gauge is fully loaded. For example, a load cell with 10 V excitation and 2 mV/V gauge factor will give 20 mV when fully loaded. The meaning of a 20 mV output depends on the type of the strain gauge. If it was designed to measure 0-1000 Kg then 20 mV indicates a 1000 Kg load.

Setup

The ACT20P Bridge has internal switch settings that determine the excitation voltage (5 V or 10 V) and Input range limits. Select the appropriate settings from the table below. Once you have set the DIP switches, you simply calibrate the unit to the input and output range for your application.

Calibration

There are three options for calibrating the ACT20P Bridge:

- Kalibrierung über einen Messbrückensimulators (Bench calibrate using a bridge simulator (if you know the gauge factor))
- Calibrate on-site by loading the actual installed strain gauge
- Bench calibrates using a mV source (if you know the gauge factor).

For more information please read the manual from the web page: www.weidmueller.com

Configurable

Bridge measuring transducer for reading from load cells

- 3-way isolation
- Supply for measuring bridges up to $4 \times 350 \Omega$
- Simple calibration of the tare weight using external switch or PLC input
- Input and output ranges adjustable via DIP switch

WAVESERIES – Signal converters

Isolation and conversion of analogue signals – enclosed in a rail-mounted WAVEBOX housing

WAVESERIES products are well suited for users seeking an analogue signal conversion solution. Weidmüller's WAVESERIES integrates a wide variety of functions into a compact, space-saving design. This product line covers a broad range of products suitable for many different analogue signal conditioning applications.

D

- Passive isolation amplifier for standard analogue signals
- Active isolation amplifier for standard analogue signals with 2-way or 3-way isolation
- Isolating signal converters for temperature (RTDs / thermocouples), resistance, potentiometer, frequency, AC/DC currents up to 60 A, and AC voltages up to 450 V.
- Measuring transducer for measuring AC currents up to 500 A
- Signal converters for all common input signals, with configuration (either DIP switch or with software)
- Signal converters with analogue and relay outputs, fully configurable via interface and software

Service

No tools are required when removing the PCB from the housing. Simply push in the locking clips on the head piece and then pull out the upper section along with the connections and the PCB.

Saves time

The ZQV 2.5N cross-connector can be used to connect the housing together in order to bridge the power supply between the modules.

Security

You must ensure the presence of "protective separation" in accordance with EN50178. The WAVESERIES products are able to fulfil these requirements completely.

Flexibility

The BLZ/ BLZF pluggable screw and tension-clamp connections offer you the best flexibility. Coding elements can be used (without loss of poles) to make sure that the wrong plug cannot be inserted.

Protection

The WAVEBOX housing is made from recyclable plastics. It is available in widths of 12.5, 17.5, 22 or 45 mm. Practically no tools are required during installation. All requirements and EMC are met. The integrated ventilation slits ensure that sufficient heat dissipation takes place.

	Universal signal converter

	Frequency converters
	Current monitoring
	Voltage monitoring
	Bridge measurement isolator/ converter
	Serial interface isolation converter

WAVE TTA – one module fits all ...

In the case of signal processing this is a big benefit. The maintenance engineer who hasn't got the right spare isolator or transmitter, and has to run part of the plant on manual control for a day or two before the replacement arrives understands this. It wastes his time and money. So Weidmüller has designed a signal processor with unique flexibility.

In one module the Wave TTA is an intelligent signal

- Isolator
- Convertor
- Transmitter
- Lineariser
- Trip-amplifier

The new WAVE TTA is a "universal" Transmitter Trip-Amplifier. It is part of Weidmüller's well-established WAVESERIES family of analogue signal conditioners, which are widely used in process and factory automation applications.

The TTA is unique. It has a combination of high performance and exceptional configurability. Designed for process industry applications, the TTA will work accurately and stably over a wide ambient temperature range, and over a wide supply voltage range, and with most types of sensor inputs. For 2-wire current transmitters 24 V DC power is provided. Alternatively the TTA can be a passive input for the current source.

Most commonly used temperature sensors and DC inputs are accepted, and the TTA also allows the user to define his own characteristics, so special sensor types and linearisation can easily be accommodated.

To help simplify installation and loop commissioning, test terminals are provided to permit input and output signal checks without removing cabling.

For linearised and/or isolated analogue outputs, the user has a choice of standard or variable DC milliamps and voltage ranges. These can be set as either direct or reverse acting. The user can also select upscale or downscale output in the event of a sensor break or an open circuit in the input.

The TTA provides 2 changeover-relay outputs which can be independently set, for use as high and low level alarms or control points.

Configuring the versatile TTA to change input and output parameters is simple, and performed from a computer via an interface (CBX200 USB).

Powering the TTA is flexible too. When the auxiliary supply is anything between 18 and 264 V (AC or DC), one module can take it.

Physically, the TTA comes in a black WAVESERIES housing with a flammability class VO acc. UL 94, for mounting on TS 35 DIN rail. Pluggable connectors, allow screw or tension clamp wiring. A screwdriver-releasable front flap gives access to the configuration interface socket.

The free software TTA-Set allows fast and uncomplicated configuration of the WAVE TTA . Easily adjustable measurement window, transmit functions and switching thresholds, as well as different thresholds and alarms for faults.

Universal input signals

- Temperature signals (such as RTDs), One module integrates thermocouples and potentiometers, frequency transmitter, DC voltage signals and DC current signals.

Current source or loop powered input

- For DC current inputs the TTA can be used with either a passive input, or provide power for a two-wire transmitter.

Wide AC/DC power input (18-264 V AC/DC)

User-definable characterisation

- If none of the standard input linearisation options suit the sensor, a special curve can easily be created.

UL Class I Div.2 and ATEX Zone 2 approvals

Inputs & outputs configurable via computer

- The range of configurability of the TTA is remarkable – and made easy using TTA SET software, in conjunction with the CBX200 USB interface.

Both analogue and relay outputs

- In one module the TTA integrates adjustable alarm or control outputs from mechanical relays, as well as its proportional analogue output.

Wide ambient temperature range (-40 to 70 °C)

- Mounting the TTA outside in the field is no problem. Its ambient temperature range means it can also be field enclosure mounted.

High accuracy and temperature stability

- The Wave TTA offers superior performance and minimises losses for data acquisition systems, with its output accuracy typically < 0.1 %, and temperature stability < 0.01 %/K

Milliamp signal testing without removing cables

- The current and voltage inputs can be tested using a supplemental test contact without loosening the existing wiring.

WAVE TTA

- Input and outputs can be configured on PC with the TTA-SET software, download at www.weidmueller.com
- Universal input signals
- Loop-powered or passive input
- Pluggable connection terminals

WTZ4 PT100/4 V 0-10V	1	8432250000

Note

Cross-connectors for power supplies and markers - refer to WAVESERIES accessories

Specify temperature range for special calibrations.

Applications**Example for Zero and Span**

Temperature adjustment	
Tmin	-10 °C
Span	75...110 °C
Span	95 °C
Adjustment of Span	+25 %

**Temperature coefficient**

Measurement range ≥ 200 K ≤ 200 ppm/°C (typ. 80 ppm/°C)
100 K ≤ Measurement range < 200 K ≤ 205 ppm/°C (typ. 90 ppm/°C)
40 K ≤ Measurement range < 100 K ≤ 450 ppm/°C (typ. 180 ppm/°C)

Aids

- Voltage supply 24 V DC, 50 mA
- Simulator for PT 100 or precision-resistance-decade
- Ampere-/voltmeter which can be calibrated to an accuracy of > 0,1 % of the end value.

Switch position/setting options

WAVEANALOG PRO Frequency

WAVEANALOG PRO Frequency
delivers settings help, for any
input and output values.

**The input range is set using
the DIP switches (a frequency
generator is not required)**

There are 2 different methods:

1. Lower measuring frequency = 0 Hz

- Choose operating mode “= ... fmax” S2.3 = 0 and S2.4 = 0
- Set the upper measuring frequency using DIP switches S1 and S2.1, S2.2 (see table)
- That's all!

2. Lower measuring frequency ≠ 0 Hz

- First the lower measuring frequency must be saved. Select mode “save fmin”. S2.3 = 1 and S2.4 = 0. Set the frequency using DIP switches S1 and S2.1, S2.2 (see table) To save the frequency, briefly connect the module to the power supply.
- Select mode “fmin ... fmax” S2.3 = 0 and S2.4 = 1
- Set the upper measuring frequency using DIP switches S1 and S2.1, S2.2 (see table).
- That's all!

Adjusting input range using frequency device to be measured:

- Select the switch setting for saving the frequency: S2.1 = 0, S2.2 = 1, S2.3 = 1 and S2.4 = 1
- Apply min. frequency to the module
- Connect the module to the power supply
- The LED lights up when the input frequency is being measured. If the LED goes off, the frequency has been saved and the module can be disconnected from the power supply again.
- Repeat with max. frequency: S2.1 = 1, S2.2 = 0, S2.3 = 1 and S2.4 = 1
- Select special range:
S2.1 = 1, S2.2 = 1, S2.3 = 1 and S2.4 = 1

Connection configuration for the sensors

f/DC isolator/converter

- 3-way isolation
- Max. input frequency: 100 kHz
- Input and output ranges can be adjusted via DIP switches
- No calibration necessary
- Supplies the NAMUR sensor
- Programmable custom range
- Can be adjusted and set using the WAVETOOL software, download from www.weidmueller.com

Cross-connector for power supplies and markers - refer to Accessories

Application

Isolating converters for serial interfaces

Isolating converters for serial interfaces RS232/ RS485/422 or TTY

Serial interface are used for exchanging data between data processing systems, controllers and peripherals. The WDS2 interface isolating converter is particularly well suited for harsh conditions located near to the process. Versions are available for a variety of industrial applications:

- RS232/RS422 or RS485
- RS232/TY

The thin (22.5 mm wide) rail-mounted modules come with a 9-pole SUB-D connector for the RS232 connection and a shield connection for the RS485/422 or TTY signal line. In order to ensure high transmission security, the serial interface isolating converters are equipped with high-quality 4-kV 3-way electrical isolation.

- **Easy to service:** the electronic components can be removed from the housing/base without using any tools. The terminating resistor can be selected with DIP switch.
- **High data transmission speeds** up to 115 kBit/s and freely adjustable
- **Secure connection:** 9-pole Sub-D connector for the RS232 interface. For the serial RS485/422 and TTY connection, the user can connect the shield using the LLBU or the EMC Set (1067470000).

RS232/RS485/422

- 3-way isolation
- RS232 connection via SUB-D 9
- RS485/422, shield connection via KLBUE
- Switchable DTE or DCE assignment
- Bi-directional communication

Trip amplifier for monitoring AC/DC circuits

Monitoring AC/DC currents and voltages within single-phase and three-phase power networks.

Some WAVESERIES products provide the function of monitoring voltage and current. Typical uses include low voltage distribution applications. This includes the monitoring of phase voltages and current while controlling actuators. Another application is in monitoring dropouts of a power supply, or accumulators and feed-in systems within industrial production lines. There are many applications for threshold monitoring (trip amplifier) products in process automation. Typically they are used to generate alarms when „out-of-limits“ signals are detected with fill levels, flow quantities or temperature signals.

The PLUGCONTROL series of current monitoring products monitor DC current up to 10 amps. They can be used in applications to monitor the functioning of valves, servo-controls and DC motors. The pluggable detector uses the same socket (base) as Weidmüller PLUGSERIES relays and optos socket base so it uses the same quick-and-easy to use pluggable ZQV cross-connections for saving wiring time. A lever is provided to quickly release or instal the detector.

Features

WAVECONTROL:

- Threshold monitoring of analogue standard signals
- Measuring AC currents ranging from 1 to 30 A
- Monitoring DC and AC voltages up to 400 V
- Fully adjustable switching thresholds
- Relay outputs for monitoring threshold
- Versatile pluggable connection method – screw or spring

PLUGCONTROL:

- Monitoring for DC currents ranging from 0.5 to 10 A
- Very small, pluggable monitoring unit
- Reed relay contact for monitoring and measuring current
- Install on standard base
- Quick initial commissioning – with replaceable electronics
- Minimal wiring effort – with pluggable ZQV 2,5N cross-connector

	Threshold monitoring of analogue standard signals
	Current monitoring
	Voltage monitoring

Relay output

- 3-way isolation
- Low trip / high trip
- FAILSAFE / NON-FAILSAFE
- 2 relay outputs 250 V AC / 3 A

NON FAILSAFE, Chan. 1 & 2	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>		<input checked="" type="checkbox"/>

= on
 = off

NON FAILSAFE: The relay picks up when the alarm is triggered.
FAILSAFE: The relay drops out when the alarm is triggered.

An alarm is also triggered in the FAILSAFE mode, if for example, the operating voltage to the modules fails

Low Trip: Alarm is triggered if the signal is under the threshold.

High Trip: Alarm is triggered if the signal is over the threshold.

Signal threshold: Adjustments of the signal threshold (1...90%) are made for channel 1 with the potentiometer P1, and separately for channel 2 via potentiometer P2.

Hysteresis: Adjustments of the hysteresis (1...10%) are made for channel 1 with the potentiometer P3, and separately for channel 2 via potentiometer P3.

Indicators and configurable displays

Indicators and configurable displays	Overview	F.2
	Process value displays with LED display	F.4
	Process value displays with LCD display	F.20

F

Indicators and configurable displays

In industrial and process automation, displays provide a visual rendering of data and an digital presentation of electrical and non-electrical measurements. They provide essential diagnostics, logging and operational guidance when operating machines and facilities.

Displays make dialogue-based operations possible. They show measurements, error messages and also allow processes to be monitored. Displays can also feature digital and analogue outputs, interference-suppression functions, or the ability to calculate certain process variables internally. This turns a simple display into a high-quality process interface capable of independently controlling sub-processes.

F

All-purpose

A fitting solution for any application
– with a multitude of input ranges,
external or input loop-powered supply,
and analogue or digital outputs.

Security

No additional signal isolation is
required since there is a high insulation
voltage.

Saves time

Easy push-button configuration.

Protection

IP 65 protection allows for use in harsh
industrial conditions.

**Flow rate or volume monitoring
with LED display**

**Process value indication with
LCD display**

Counters

PTX800 SERIES

Panel-mounted totaliser/counter/rate monitors

The configurable monitors of the PTX800 SERIES are available in two designs:

- PTX800A for analogue (mA, Volts) inputs
- PTX800D with digital pulse inputs (NAMUR, NPN/PNP sensors, TTL, etc)

The eight-digit LED rate/total display can be changed via a button on the front of the unit. Both versions make use of output relays to close values when the "total" setpoint is reached. They also have electrically-isolated analogue outputs for re-transmission.

F

The display can be globally scaled based on the flow quantity per second, minute, hour or day. The flow-quantity counter can be multiplied by factors of 0.001, 0.01, 0.1, 1, 10, 100 or 1000. This allows for best use of the display.

The PTX800A counter processes standardised analogue current and voltage signals. Linearisation and filtering functions are available for processing measurement signals. In addition, the counter has a 24 V DC power supply for loop-powered sensors.

The PTX800D can be connected on the input side to all standard initiators (NPN/PNP/Namur) and with other current/voltage transmitters. The monitor will accept any periodic signal type and can total the input pulses into a "total" display.

It can also calculate the resulting flow rate. External proximity switches can be supplied with 12 V DC directly from the PTX800D.

Typical application of PTX800

Technical Features

- Display of the flow quantity/rate
- Easily-readable eight-digit LED display
- Up to two outputs for alarm monitoring or control
- Optional analogue output
- Pulse output
- Reset function can be controlled locally or remotely, for fill-quantity monitoring (batching)
- The most recent measured value is stored in case of a power outage
- DC power supply
- LED display for values outside of range
- Complete electrical isolation
- DIN-standard 1/8 front panel with IP 65 protection
- Integrated power supply for initiators
- Changing the device configuration is possible without performing a new calibration
- No internal adjustments needed

Indicators and configurable displays for analogue signals

PMX420 SERIES

Universal, 4-digit, current/voltage displays

The current/voltage displays of the PMX420 SERIES are available as a pure display unit or optionally with analogue outputs/4 alarm outputs.

The basic model is suitable for displaying a wide range of bipolar mA or voltage signals. Inputs are isolated from the power supply. An integrated power source is available for supplying external sensors and transmitters.

The PMX420 Plus adds four alarm channels (each with its own status indicator and relay contact outputs) and a fully isolated analogue current/voltage output.

F Device functions can be configured, specifically for the application, using the integrated keypad on the front panel. There are also several other handy features like maximum and minimum value recall, integrated linearisation, an acoustic alarm, a group alarm function, and the option for manual or automatic alarm reset.

Technical features:

- 4-digit LED display
- Suitable for current and voltage signals
- Bipolar inputs
- Integrated square root function
- Retrieval of min. and max. values
- Integral power supply for active sensors
- DC power supply
- Complete electrical isolation
- Four alarm channels and an analogue current/voltage output (PMX420 Plus)
- LED alarm status indication
- DIN-standard 1/8 front panel with IP 65 protection
- Decimal point can be adjusted to any position
- Configurable via front-panel keypad

Typical application of PMX420 Plus

Indicators and configurable displays for temperature

PMX400 SERIES

Four-digit temperature and frequency displays with analogue-value read-out and alarm monitoring

The PMX400 SERIES consists of two modules:

- Temperature display
- Frequency display / tachometer

A variety of temperature or frequency signals can be processed. On the output side, optional analogue signals are available, as well as either two or four relay contacts for alarm monitoring. The PMX400 HZX frequency display module offers, as default, two open-collector outputs as the relay contacts. The outputs are designated for the alarm function. An integrated power supply can be used for supplying external sensors and input devices.

F

Technical features:

- Four-digit digital LED display
- Up to four alarm channels and an analogue current/voltage output
- Retrieval of min. and max. values

Universal auto-manual stations

AMS400A

Universal auto-manual stations

The AMS400A modules are interface devices which are used between controllers / PLCs and valves / actuators in the field. They implement auto-manual transfer operations for automatically controlled processes.

Typical applications are:

- Manual start-up of sensitive processes before handover to automatic control
- Manual over-ride in case of controller failure or malfunction.

The AMS400A offers three different I/O configurations, which serve as interfaces between:

- Analogue control equipment and analogue control devices
- Digital control equipment and analogue control devices
- Digital control equipment and digital control devices

In AA (analogue-analogue) mode, it is possible for a remote source to switch between manual and automatic operations using digital inputs. Ramp rates and additional handover. Two options are available for the method of returning to automatic control, in order to ensure a bumpless transfer.

Typical application of AMS400A

AMS400A

Indicators with scalable displays

DI350

3½-digit LED display, auxiliary powered

The DI350 is a pair of inexpensive 3½-digit displays - one for analogue current (4-20 mA) and the other for voltage (0-10 V) signals, for use in industrial applications.

An integrated regulated power supply can be used to supply two-wire transmitters.

The decimal point can be moved to any of the positions (1.XXX, 1X.XX, 1XX.X or 1XXX) so that it can display values in any range.

The bright seven-segment LEDs are easily visible even in weak lighting. The special filtering properties of the front face give it a wide viewing angle.

The DIN-standard 1/8 front panel with IP 65 protection ensures reliable operation in wet areas. The connection uses pluggable screw-connection elements.

The DI350 models are hazardous area approved cuLus Ex (Class 1 Div. 2, Groups A, B, C & D)

Typical application of DI350

Indicators and configurable displays

LPD350

3½-digit digital display, loop powered

The LPD350 is a compact, cost effective, 3½ digit digital indicator designed specifically for current loop signals. The decimal point can be moved to any position (1.XXX, 1X.XX, 1XX.X or 1XXX) so that it can display values in a range of ± 1999 .

The LPD350 uses a liquid crystal display which can be read even under poor lighting conditions.

No additional wiring is needed for a power supply. The user can simply break the loop and connect to the LPD350.

The housing has a DIN-standard 1/8 front panel with IP 65 protection. The connection uses pluggable screw-connection elements.

Technical features:

- Large 3½-digit digital LCD display
- 4...20 mA input
- Loop-powered two-wire design (125 Ω loop load)
- Direct or reverse-action display
- Linearity is $\pm 0.1\%$ of the corresponding signal range
- DIN-standard front-panel with IP 65 protection
- Pluggable screw-connection mechanism
- Hazardous area approved cuLus Ex (Class 1 Div. 2, Groups A, B, C & D)

Typical application of LPD350

LPD350

- Display instrument for control panel installation
- 1/8 DIN standard front
- 3½ digits
- IP 65 fully insulated
- Pluggable connection terminals

Configurable IP 67 field-mounted LCD indicator

LPD405F

4½-digit display, loop powered

The display is loop powered by the 4...20 mA current loop with no external supply required. The twenty-mm LCD displays can be read even under poor light conditions.

A sheet of perforated self-adhesive labels is included. They include standard engineering units and can be used for all label needs.

The electronic subassembly is housed in a rugged, glass reinforced polycarbonate, IP 67 case. This housing is suitable for any industrial environment.

Optionally available is a pipe mounting bracket which can be used for horizontal and vertical mounting.

Technical features:

- Big 20 mm LCD display
- 4...20 mA inputs (two-wire loop-powered)
- Integrated signal linearisation (\sqrt{x} , $x^{3/2}$, $x^{5/2}$ or user-defined)
- Min./max. value display feature
- IP 67 protection
- Pipe mount bracket option
- Hazardous area approved cULus Ex (Class 1 Div. 2, Groups A, B, C & D)

Typical application of LPD450F

LPD450F

- Display instrument for outdoor use
- 4½ Digits
- IP 67 fully insulated
- Optionally available with fixing clips for pipe mounting

Accessories Analogue Signal Conditioning

Configure, calibrate, mount, mark, (cross-) connect.

A comprehensive line of accessories is available for the analogue signal converter product family. The line includes configuration adapters for software-programmable products, interface modules, calibrators and mounting accessories (such as cross-connectors, end plates and terminal connectors) – all naturally in the top Weidmüller quality that you've come to expect.

The CBX200 USB is a USB2.0/RS232-interface converter with galvanic isolation. It has additional functionality for controlling and supplying the connected RS232 device. The CBX200 USB makes it possible to configure the intrinsically safe ACT20X product line and the WAVE TTA signal converter.

The CBX200 USB is not compatible with the CBX100 USB.

Table for selecting a configuration adapter

Product	CBX100	CBX200
ACT20X		X
WAVE TTA	X	
ITX+	X	

Pin assignments for jack plug

DTR*	Vcc
0	3,3 V
1	0 V

Control input	RTS*	RS232 interface
12 V	1	active
12 V	0	active
0 V	1	active
0 V	0	not active

* RTS and DTR are internal control signals

Installation notes

The power supply to the device comes from the USB port via a USB type-A plug. The output-side of the RS232 interface uses a four-pole 2.5-mm jack plug to connect. This jack plug is also capable of activating the RS232 interface when needed with a 12-V control voltage. With the assistance of the DTM, the USB interface is diverted to a COM interface. The RS232 interface can be activated with an RTS signal (RTS = 1 → output activated) via the diverted COM interface. The jack plug is also capable of supplying the RS232 node with a regulated voltage of 3.3 V at 4 mA current. The DTR signal (DTR = 0 → supply activated) is used for control. It is also possible to query the status using the DSR signal (DSR = 0 → output activated).

The "WI-Manager" software, the "TTA Set" and the DTM library can all be downloaded free of charge from www.weidmueller.com.

CH20M DIN rail bus

Quick and safe power supply through the mounting rail.

This customer-friendly infrastructure solution brings power, signals and data to the rail in a quick and reliable manner. The DIN rail bus can replace the tedious individual wiring process with a flexible and uninterrupted system solution. As a result, the wiring overhead and the error rate are both reduced. The uninterrupted system bus is securely integrated within the 35 mm standard mounting rail. Whether 7.5 mm or 15 mm high, the custom-fit rail profiles are easy to install on all TS 35 standard rails in accordance with DIN EN 60715.

The resistant gold-plated contacts ensure a permanent and reliable contact. The ACT20M modules are simply snapped onto the mounting rail and are automatically in contact with the DIN rail bus.

The supply to the 24 V power supply can be from either one of the modules (up to 400 mA) or a separate power supply terminal (up to 4 A). This is sufficient for up to 120 modules. The ACT20-Feed-In-Basic provides a simple and compact (6 mm width) power supply terminal solution. The ACT20-Feed-In-Pro is a more powerful 22.5 mm wide solution. This makes a backup power supply that includes error messaging possible.

Power-feed module for the CH20M DIN rail bus

4 A supply with backup supply and error analysis

The power-feed unit ACT20-FEED-IN-PRO-S supplies the devices on the CH20M DIN rail bus with 24 V DC. At the same time, the FEED-IN device reads the group error contact – optionally provided by the installed devices – from the CH20M rail bus and sends a message through the status relay to the external controller. Optionally, two power supplies can be connected for the primary and secondary supplies (backup). An installation in Zone 2 / Division 2 is also possible. Three LEDs show the status of the power supply and the error status.

The FEED-IN-PRO can supply a maximum of 4 A to feed up to 120 devices mounted on a CH20M rail bus. Quick identification of errors on the DIN rail bus is through the internal status relay. The FEED-IN-PRO device immediately recognises and displays when a power supply has failed. The supply is then switched automatically to the redundant power supply.

Weidmüller offers a compact and narrow 6 mm feed-in module as an alternative. This wires the terminal level directly to the DIN rail bus. Up to 80 modules can be fed with a maximum available current of 2.5 A.

ACT20 power-feed module

- Distributes the supply onto the busbar
- Compatible with Weidmüller CH20 DIN rail bus
- Optional connection for backup supply
- Approved for use in Ex-Zone 2 /Div. 2
- Monitoring of the supply voltage
- Alarm alerts via the status relay

Portacal 1000EU

Calibration device for current and voltage signals

The Portacal 1000EU is a calibration device which is controlled by a microprocessor. It is used for current and voltage signals. It has three output modes for simulating signals:

- **Voltage source:** for the simulation of externally-supplied voltage transmitters
- **Current source:** for the simulation of externally-supplied current sensors
- **Current sink mode:** simulates the outputs of a two-wire (loop-powered) transmitter.

Commonly used calibration functions can be invoked for each mode by pressing a button. Up to 9 storage locations per mode are available to save the individual values.

Furthermore, the Portacal 1000EU can be programmed in a way that all modes can be cycled automatically. The corresponding values are controlled continually for a pre-defined time by means of a value storage. The following values can be checked and parameterised:

- Voltage outputs
- Current outputs
- Two-wire transmitter outputs

The Portacal 1000EU provides the necessary voltage supply for the sensor in order to check a two-wire transmitter.

Technical features:

- Complete diagnosis tool for current and voltage supply
- Measuring and simulating of voltage and current signals
- Simulation of function of signal transmitter, which can be auxiliary-powered or process-powered (two-wire type)
- Continually adjustable step and ramping function
- Accuracy < 0.05 % in all signal domains
- Light and portable
- Supply via NiMH rechargeable battery or comparable battery
- Signal tone at the press of a button

Typical application of Portacal 1000EU

PORTACAL 1000EU

Instrument Calibrator

Technical data**Output voltage mode**

Output voltage	0...13 V
Resolution	0.01 V
Load current	0...10 mA
Accuracy	±5 mV
Residual ripple	< 1 mV
Internal storage	Nine user-defined voltages

Output current mode

Output current	0...26 mA
Resolution	0.01 mA
Load resistance	600 Ω @ 20 mA (power source)
	100 Ω (current sink)

max. input voltage current sink

Accuracy	±5 μA
Residual ripple	< 1 μA
Internal storage	Nine user-defined currents

Input voltage mode

Input voltage	0...13 V
Input resistance	200 kΩ
Accuracy	±5 μA or ±1 digital step

Input current mode

Input current	0...26 mA
Input resistance	47 Ω
Accuracy	±5 μA or ±1 digital step

Loop powered mode

Type	Mode for loop-powered signal-convertisers
Input current	0...26 mA
Feed voltage	16 V ±10 %
Accuracy	±5 μA or ±1 digital step

Auto step/ramp mode

Step	Output of each value within a certain time period
Ramp	Output via a programmed ramp function
Number of recorded values	2...9
Time interval	10...4200 s

Display

Type	Four-digit display with LCD, 12 mm
Status indicator	Five LEDs for output mode, signal amplification and reduction
Display value	Percent or real-value displayed

Keyboard

Type	16 buttons with acoustic signal
Calibration	Adjustable fixed values: 0, 2, 4, 8, 10, 12, 16, 18, 20 mA 0, 1, 2, 4, 5, 6, 8, 9, 10 V
	Nine freely-definable values
	1 / 0.1 / 0.01 mA or V

General data

Supply voltage	Battery, 4x type „AA“
Temperature coefficient	< 0.01 % / °C at 100 %
Ambient temperature (operational)/storage temperature	0 °C...60 °C / -25 °C...+70 °C
Type of connection	Sockets
EMC standard	DIN EN 61326
Approvals	CE, cULus

Dimensions

Length x width x height

Portacal 275

Hand-held signal source and loop calibrator

The Portacal 275 is a precise hand-held signal source for current and voltage signals. It can be used in four modes which allows the calibration of standard current/voltage transmitters.

The operating mode "voltage source" simulates auxiliary-powered transmitters with proportional voltage outputs. The mode "current source" allows emulation of transmitters with proportional current outputs. The "mv source" mode simulates a variety of other analogue signals from many different applications. The "current sink" mode simulates the outputs of a two-wire (loop powered) transmitter.

The Portacal 275 is equipped with a scalable potentiometer (0 to 100 %) that can be adjusted in steps to an accuracy of 0.1 %. Together with the output-range switch, the potentiometer allows for a quick and precise adjustment of the signal value. A typical accuracy of $\pm 0.25 \%$ is possible. An integrated test point, for connecting external measurement devices, allows for a higher accuracy of $\pm 0.1 \%$.

Technical features:

- Light and portable device
- Simulates loop-powered transmitter operation
- LED for indication of source/sink operating mode
- Current ranges: 0 to 20 mA / 4 to 20 mA / Voltage ranges: 0 to 5 V / 1 to 5 V / 0 to 200 mV
- 0.1 % accurate current source
- Test points for current output monitoring
- Switch select 0 %, 100 % or variable output
- Signal outputs can be adjusted with spindle potentiometer for high accuracy
- Powered from two 9 V block batteries

Portacal 275

Calibration device for current and voltage signals

**Technical data****Output of voltage mode**

Output voltage	0...5 V / 1...5 V; 0...200 mV / 40...200 mV
Resolution	0.01 V
Output resistance	250 Ω @ V / 10 Ω @ mV
Accuracy	< 0.2% (0% and 100%)

Output current mode

Output current	0...20 mA
Resolution	0.01 mA
Last resistor, max.	700 Ω (current source) $(V_{out} - 4) / 0.02 \Omega$ (current sink)
Output voltage, max. @ current sink	4...45 V DC
Accuracy	< 0.1% (0% and 100%)
Residual ripple	< 1 μA

Settings

Range of adjustment	0...20 mA / 0...200 mA (current source).0 ...5 V (voltage source) or as current sink selectable with toggle switch
	0...100 % with precision potentiometer 0 or 100 % with toggle switch

General data

Temperature coefficient	typ. 40 ppm @ °C
Accuracy	0.25 % of signal range
Supply voltage	Batteries, 2 x 9-V blocks 6...22 mA (current source) 2 mA (current sink)
Ambient temperature	0 °C...60 °C
Storage temperature	-25 °C...70 °C
Type of connection	Socket
EMC standards	DIN EN 61326
Approvals	CE; cULus; EAC

Different types of analogue signalling

The working environment can be measured in many different forms, e.g. in terms of temperature, humidity or air pressure. The values of these physical variables change constantly. Components that monitor the status and changes of a given environment and provide alerts of any changes must be able to continuously display the changes taking place.

In industrial and process automation, the outputs received from field sensors, switches and transmitters provides measurement and status data which becomes the analogue and digital inputs (AI and DI) for the control system. Similarly, control signals are passed from the control system to field control equipment such as analog and digital valves and actuators.

If automation processes are expected to reach certain statuses or keep them constant, then analogue signal conditioning is required. It is also important in areas where this has already been part of long established practice, e.g. in process engineering or the chemicals industry.

In process engineering, standardised electrical signals are normally used. Currents of 0 ... 20 mA, 4 ... 20 mA or voltages of 0 ... 10 V have become established as the output variables for sensors recording various different physical parameters.

Weidmüller takes account of the growing preference for automation – including and the resulting need for analogue signal conditioning – and offers a wide range of products tailor-made to the requirements involved in handling sensor signals. Units for the common signals (0 ... 20 mA, 4 ... 20 mA, 0 ... 10 V) generate an output signal as a proportional value of the variable input signal. “Protective separation”, e.g. of the sensor circuit from the evaluation circuit, is also taken into account. “Protective separation” prevents mutual interference among several sensor circuits, e.g. as in the case of earth loops in interlinked measuring circuits.

The wide range of Weidmüller products completely covers the functions involved in signal conversion, signal separation and signal monitoring. The products can thus handle nearly all applications in industrial measuring technology, and safeguard elementary functions between field signals and further processing systems. The mechanical properties of the products are built up around a consistent concept.

Signal converters can be used with other Weidmüller products and combined with each other. They are designed to entail a minimum wiring workload and maintenance in both electrical and mechanical terms.

The product range contains the following functions:

- DC/DC converters
- Current converters
- Voltage converters
- Temperature converters for resistance thermometers (RTDs) and thermocouples
- Frequency converters
- Potentiometer transducers
- AC transducers
- Bridge transducers (strain gauges)
- Threshold monitoring modules
- AD/DA converters

The products are available as pure signal converters, or with 2-port or 3-port isolation and a choice of passive or output loop powered or auxiliary powered, depending on the application requirements.

2-way isolation separates the signals from each other electrically and decouples the measuring circuits. Potential differences – caused by long line lengths and common reference points – are eliminated. Furthermore, the electrical separation protects against irreparable damage caused by overvoltages as well as inductive and capacitive interference.

3-way isolation decouples the supply voltage from the input and output circuits as well and enables the function to operate with just one operating voltage.

The **passive separator** offers an extra, decisive advantage – it requires no additional voltage supply. The power supply to the module is achieved via the input or output circuit and is transmitted to the input/output. This current loop feed is characterised by a very low consumption.

A number of products are available for temperature measurements. For example, **PT100** signals in 2-, 3- and 4-wire systems are converted into standard 0...20 mA, 4...20 mA and 0...10 V signals.

The modules for connecting conventional **thermoelements** are fitted with cold trap compensation as standard. Furthermore, they amplify and linearise the voltage signal provided by the thermocouple. This guarantees accurate analogue signal conditioning while eliminating sources of interference or error.

Frequency converters convert frequencies into standard analogue signals. Downstream controls can therefore directly process pulse strings for measuring rpm or speed.

AD or DA converters are required for bringing together the analogue signal forms mapping the local conditions and the digital processing in the process monitoring system. Weidmüller can supply such components for the customary 0...20 mA, 4...20 mA and 0...10 V input and output signals. 8-bit processors are available on the digital side.

Current-monitoring modules can be used to control DC and AC currents up to 60 amps. A switching operation is triggered when the set current values are not met or exceeded. Components with analogue outputs monitor the current load continuously via downstream controls.

Voltage monitoring modules can be used to monitor AC and DC voltages. Adjustable switching thresholds can be used to reliably detect and notify in the event of fluctuations caused by switching operations or mains overloads.

Technical data

Common Mode Noise Elimination

- Generally, signals emitted by sensors have low levels and are thus susceptible to capacitive and inductive interference, such as those generated by motors, frequency changers and other change processes. This noise contents the measuring value and frequently destroys expensive analog I/O cards in the control electronics. Through the utilisation of analogue signal isolators this interface, which usually actions both signal lines in common mode (push push), is effectively eliminated through the zero potential input.

Active Isolator / Passive Isolator

- Active isolators draw their power supply from a separate supply terminal to ensure that they can operate perfectly. Depending upon the applications the input, output and additionally the power supply are isolated from each other. Only one supply is required for 3-port isolation. However, it is isolated from the input and output circuits. Thus even in the event of a short circuit, surge voltage or reverse polarity, the downstream control electronics cannot be damaged. Isolating the signals between the input and output can be conducted either optically or by transformer barrier depending upon the transfer rate. Active isolators are non interacting, i.e. a change in the load does not exert any influence on an input circuit.
- Passive isolators generate the current required for the supply from the measuring signal. The current required internally is so small that transfer problems do not occur here.
- The feed can be effected from either the input or the output side. Isolation is by transformer barrier. The advan-

tages are: cessation of network influences, outstanding accuracy, low signal delay and low potential requirement. Passive isolators are not non interacting; a change in load in the output circuit will influence the input circuit.

Ground Loops

- The voltage supply's secondary side is earthed for the purpose of setting up fast and secure ground loop monitoring. If an analogue signal is fed in from a separate voltage supply or if the sensing device itself is earthed, then transient currents will flow between the ground potentials across the interconnected ground connectors, which in turn corrupts the measuring signal. Analogue signal isolating amplifiers prevent this form of measuring signal corruption and influence.

2-port Isolation

- The simplest form of analogue signal isolator is that of 2-port isolation. It serves to isolate the input circuit from the output circuit as well as the two auxiliary voltages from each other. Depending upon the isolator design and the observed isolation data one refers here to base isolation (galvanic isolation) or safe separation. ① For current signals, 4...20 mA input current loop fed modules are available. An additional auxiliary voltage for the input circuit is not required here. ② By connecting the input and output side voltage supplies, the 2-port isolation can be converted to operate as a simple signal converter. This is of particular interest where isolation is not required for an application, but a signal conversion has to be performed.

3-port Isolation

- 3-port isolation is the most universal form of signal isolator
- An optical coupler or transformer isolates the input from the output circuit. Together with the clearance and creepage distances it serves to define the isolation level. For example, the input signal is converted by means of pulse-width modulation into a frequency signal and demodulated again on the output side to form an analogue value. An amplifier then generates a standardised analogue signal. A galvanic isolated DC/DC converter feeds the input and output circuit with a potential free supply voltage. It also determines the isolation level through its data, air and creepage distances. In the case of these three isolation paths (input/output, input/auxiliary voltage, output/auxiliary voltage) one refers to 3-port isolation.

Temperature Signal Measuring Method

- Measurement using resistors (RTD)
- When measuring with temperature-dependent resistors a current of approx. 1.5 mA is passed through the resistor from a constant current source in the signal converter.

An operational amplifier is used to measure the potential drop at the resistor (2-wire circuit).

In order to take account of lead length, the voltage drop is measured at the return conductor and calculated with double the value (3-wire circuit). This simulates the wire resistances from the feed and return lines.

Accurate measurements are achieved by separately measuring the voltage drop at the feed and return lines (4-wire circuit). The values for the supply lines are calculated against the measured value.

Temperature Signal Measuring Method

- Measurements using thermocouples

When conducting measurements using thermocouples the voltage that is generated when two differently alloyed metals come into contact with each other is measured. A differential amplifier is then used to recondition the signal. The easiest (and the most cost-effective) method of subsequent processing is conducted by means of an amplifier circuit, which converts these signals into standard signals. High-end components process the measuring signal using a microprocessor, which simultaneously reconditions the signal (filtering, linearisation)

Cold Junction Compensation For Thermocouples

- Recording temperatures by using thermocouples encounters the problem of a thermal voltage forming at the clamping terminals on the signal converter on account of the different materials in the conductors and bus bar. This voltage then counteracts the thermal element's voltage.

In order to compensate for the error to the measured value which arises here, the temperature is measured at the clamping terminal. The microprocessor in the signal converter reads the value measured there and calculates it against the measured value. This procedure is known as cold junction compensation.

$$\begin{aligned} & \text{Voltage at the measuring point } (V_{\text{meas}}) \\ & + \text{Voltage at the terminal } (V_{\text{terminal}}) \\ & = \text{Voltage at the thermocouple } (V_{\text{thermo}}) \\ \Rightarrow & \text{Temperature at the thermocouple } (T_{\text{thermo}}) \end{aligned}$$

Linearisation

- Temperature-dependent components do not normally have linear characteristic curves. To ensure that further processing can take place with the necessary accuracy, these characteristic curves have to be linearised to some extent. The graph showing measurements of thermocouples, in particular, reveals significant deviations at some points from the "ideal graph". As a consequence, the signal which has been measured is worked up by microprocessor.

The microprocessor compares the value measured with the characteristic curve for the thermocouple in its memory and calculates the corresponding value on the "ideal characteristic curve". At the output, it supplies the latter to an amplifier, which produces the analogue value in linear form. The output stage converts this into a standardised value or into a switching output with a switching threshold.

The linearisation of PT100-elements can be undertaken via simple amplifier stages. The first stage corrects the peak value of the graph of the measurements. The deviation at the end of the graph resulting from this is corrected by a second stage. The under- and over-shooting generated in this way is very slight and is covered by the tolerance for the module.

Current Measurement Using A Measuring Transformer

- Transformer principle: Each conductor through which current flows is surrounded by a magnetic field H , the intensity of which is proportional to the current. The field, which is bundled in a magnetic core, generates a magnetic flux B , through which suitable sensors are used to measure current.

Converters with transformer-type couplings are used to establish the most cost effective measurement method for simple sinusoidal currents. The current to be measured flows directly through the measuring transformer's primary winding.

The secondary winding supplies the measuring electronics with a proportional current signal. Because of power loss this method of measuring current is limited to smaller currents up to 5 A. These converters react sensitively to peak loads and therefore have to be fused on the primary winding side.

Measuring Current Using A Hall-type Sensor

- Hall-type sensor principle: Hall-type sensors also measure the magnetic flux B and supply a proportional voltage at the measured output, which is then reconditioned to form a standard signal by an amplifier circuit.
- Components with Hall-type sensors are ideally suited to measuring higher currents, as any possible high residual currents from motors or peak loads cannot damage the component. Additionally, they are also ideal for measuring direct and alternating currents of various curve shapes.

Root Mean Square Measurement / Crest Factor

- The root mean square value (r.m.s) of a sinusoidal shaped alternating current is the value, which in an ohmic resistor converts the same (effective) output as that of an equal sized direct current.
- Non sinusoidal shaped signals can only be measured with "True RMS" capable devices and/or further processed.
- True RMS = True root mean square
- Root mean square measurement is required where the (effective) output content of alternating voltages or currents are to be measured or evaluated.
- The crest factor indicates the ratio of the crest factor to the root mean square value.

Load / Load Resistor

- The load is a load resistor on the output side of a measuring transducer or isolating amplifier. The load is usually less than $500\ \Omega$ at the current outputs. Voltage outputs are normally under a load greater than $1\ K\Omega$.

Galvanic Isolation / Safe Separation

- Galvanic isolation is understood to mean an electrical isolation between the input and output circuit and the circuit's supply voltage. It can be set up either optically using an opto coupler or with a transformer. The isolation serves to safeguard the measuring circuit against damage and to eliminate ground loops, which could cause the measured signal to be corrupted.
- Safe separation is specified under the German DIN VDE 0106 Section 101 standard. This fundamental safety standard is intended to safeguard persons against hazardous body currents and describes the basic requirements for safe separation in electrical operating equipment. Thus, for instance, the voltage supply of 50 V AC/ 75 V DC as under 50178 may not be exceeded. If this voltage is exceeded a reinforced or double insulated and thus an increase in the clearance and creepage distances is stipulated.

Cut-off Frequency

- Cut-off frequencies indicate the dynamic transfer characteristic of an isolation amplifier.
- The given frequency is the (-3dB-) limit, at which a distinct change occurs to the signal.
- An increased cut-off frequency leads to a transmission of higher-frequency alternating components, which corrupts the required signal.

Hysteresis

- Hysteresis indicates the percentage difference between the input and output points of a switching contact. It should not be lower than a given minimum value, as otherwise a specified chase can no longer be implemented.

Broken-wire Detection

- When measuring transformers with broken wire detection the input signal is monitored permanently. In the event of a fault (broken wire) the output signal exceeds its rated range. The downstream control circuit can then analyse the fault case.

Response Time

- Response time refers to the change in output signal for an input signal jump (10 ... 90%). It is directly related to the cut-off frequency (inversely proportional).

Accuracy / Temperature Coefficient

- Accuracy describes the capability of a measuring device to deliver a measured value as accurately as possible. It relates to the end value and is given for ambient temperature (23 °C). Example:
An RTD is given with an accuracy of 1 %. The measuring range is set to 0 – 200 °C. The expected effective error of: $200 * 1 \% = +/- 2\text{ K}$ applies across the entire measurement range.
- Temperature coefficient describes the deviations in accuracy of the measuring devices dependent on the ambient temperature. It is given as a % or in parts per million / Kelvin (ppm /K).
Example:
An RTD with an accuracy of 1 % and a measuring range of 0 – 200 °C has a temperature coefficient of 250 ppm / K. If the device is operated at +40 °C, it will then contribute the following to an expected absolute error: $(([40\ ^\circ\text{C} - 23\ ^\circ\text{C}] * 250\ \text{ppm/K}) + 1\ %) * 200\text{K} = +/- 2,85\text{K}$ across the entire measurement range.

FDT/DTM – The standard solution for device configuration

Field Device Tool (FDT)

FDT technology specifies and standardises the integration of communicating devices from different manufacturers. It makes use of a superimposed device management program. The key feature is its independence from the communication protocol and software used by the device and the host system. FDT allows access to any device from any host using any protocol.

Device Type Manager (DTM)

Device manufacturers make available a Device Type Manager (DTM) software driver for each device or device group. The DTM specifies all device-specific information, functions and rules (such as the device structure, communication capabilities, internal dependencies and the human-machine interface (HMI)). DTMs define functions for access to device parameters, troubleshooting, configuration and operation of devices. DTMs are available which can be simple GUIs for setting device parameters or more complex applications that are capable of carrying out calculations for diagnostic or maintenance purposes.

There are several different types of DTMs:

- **Device DTM**

This is a “normal” field device that uses communication channels to communicate with the connected physical device.

- **Communication DTM**

This is a communications device that provides communication using communication channels. Communication channels provide access to the communications infrastructure (such as PC interface cards or modems). They are used by device DTMs or gateway DTMs for communication services.

- **Gateway DTM**

This is a gateway device. It allows data to be exchanged between two communication channels. For example, this could be a gateway between PROFIBUS-DP and PROFIBUS-PA.

The DTM is loaded and started up within a FDT container program or “frame” application.

FDT frame application

Frame applications can be used as a tool to configure devices, plan projects, operate consoles or administer facilities. The FDT frame application provides a PC software environment with the following functions:

- User administration
- DTM administration
- Data management
- Network configuration
- Navigation

Weidmüller offers their WI-Manager FDT frame program to the user for no cost. This certified software is compatible and works together with all certified DTMs. This screenshot shows the WI-Manager with an opened DTM for the ACT20X series.

Download at [www.weidmueller.com!](http://www.weidmueller.com/)

FDT User Group

The FDT User Group is an alliance of users and manufacturers interested in defining the specifications and moving the FDT/DTM technology forward. Weidmüller is a member of this group along with most process automation manufacturers and work towards advancing this standard further.

More details are available at <http://www.fdtgroup.org/>

Safety in hazardous areas

When operating electrical devices within hazardous areas, you must comply with the requirements regulating their use in such zones. Explosive atmospheres may be created from mixtures of flammable gases, mists, vapours or dusts. If their concentration is high enough in the surrounding air, any source of ignition or spark could trigger an explosion. Such explosions can cause death, serious injuries and significant property damages.

There are basically two strategies for reducing the risk of explosion. Firstly, no dangerous materials should be released into the air that could create an explosive atmosphere. Secondly, there should be no mechanism present that could create a spark.

Many explosions in the past could have been avoided if only the international regulation governing the use of equipment in hazardous areas had been observed.

But what are the most important global regulations regarding the use of devices in hazardous areas?

In North America, the US National Electric Code (NEC) regulations (Articles 500 to 505 and the Canadian CEC (Canadian Electrical Code) Articles 18-000, -090, -100, -200 and -300 are all valid.

In Europe, both EU directives ATEX 95 (94/9/EG) and ATEX 137 (1992/92/EC) are relevant. They describe preparation (ATEX 95) and usage (ATEX 137) for facilities in potential Ex zones. Throughout the rest of the world, there is a mixture of national regulations (in Eastern Europe) and international IECEx conformity declarations (in Asia) that must be followed. In certain Asian countries, the European ATEX directives have been accepted and applied.

A brief overview of regulations used throughout the world and their basic content.

The European ATEX Regulation applies to facilities and their usage in hazardous areas.

The term "ATEX" derives from the French phrase "Atmospheres Explosive". The regulation currently includes two directives from the European Union concerning explosion protection. These are the ATEX operational directive 1999/92/EG (ATEX 137) and the ATEX product directive 94/9/EG (ATEX 95). The ATEX 137 operational directive specifies the minimum requirements for improving the protection of health and security of workers in environments at risk of explosions. The ATEX 95 product directive specifies the rules for introducing products on the market that will be used in zones where there is risk of explosion. This directive is the first to include non-electric devices within its jurisdiction.

The purpose of the directive is to protect personnel who work in hazardous areas. Appendix II of the directive contains the basic health and safety requirements. These must be followed by the manufacturer and compliance must be proven by declarations of conformity. Since June 30, 2003, all devices, components and protective systems brought to the market must be in compliance with the ATEX 95 product directive.

The ATEX 95 directive classifies devices and components for the Ex zone into two main groups:

Group I

- => Devices for use in mining, for underground and above-ground operations
 - Coal dust
 - Methane
 - Harsh operating conditions

No additional divisions

Group II

- => Devices for use in the other hazardous areas

For applications in the oil, gas and chemical industries, it is particularly important to follow the Group-II "G" requirements concerning electrical or electronic devices and components.

Safety in hazardous areas

Group II "G" divides the Ex zone into three zones with different safety requirements.

- **Zone 0** This zone applies to dangerous explosive atmospheres where the risk is present often or over long time periods.
=> > 50 % of the operational time, or more than 1.000 hours per year.
- **Zone 1** This zone applies to situation where explosive atmospheres may occasionally be present during normal operations.
=> Occasionally, less than 10 hours per year.
- **Zone 2** This zone applies to situation where explosive atmospheres are normally not present or only briefly present during normal operations.
=> Max. 30 min/year.

Hazardous areas

	Zone 0	Zone 1	Zone 2	Safe zone
Explosion risk	Continual, long-term, often	Occasionally	Rarely	None
Spark source	None	Rarely and short-term	Occasionally	Continual, long-term, often

Typical division of zones at a fuelling station

In which operations are ATEX-certified electronic devices (such as signal converters, isolation amplifier, Namur switches and switching amplifiers) used?

ATEX-certified devices are used within industrial facilities and production halls where there is the possibility that explosive gases or dusts may be released.

Transportation and production applications which require the use of such certified devices are listed below:

- Off-shore oil and gas drilling
- Tanker ships which carry oil, gas or chemicals
- Ships which carry potentially explosive materials
- Refineries and other oil or gas production plants
- Transportation and filling stations for oil and gas
- Petro-chemicals

What are the differences between standard devices and intrinsically safe devices?

For electronic devices that are being used in Zone 0(20) or 1(21), none of the components or electrical circuitry are permitted to generate unallowable high temperatures or sparks, whether during normal operations or during malfunctions. In other words: "All of the circuits in intrinsically safe electrical devices (Ex i) are safe and are not capable of igniting explosive atmospheres".

What is the device category?

The device Group II (hazardous areas not including underground or above-ground mining operations) is divided into device categories 1, 2 and 3. They have the following safety levels:

Surroundings	Device category	Occurrence and duration of explosive atmosphere	Ignitable materials	Safety levels Permitted errors	Groups and zones Comparison
Group II	1	Constantly occurring Long-term Regularly	Gases, vapours, mist, dust	Very high safety level 2 different protection classes or 2 independent errors	Group II Zone 0 (gas) Zone 20 (dust)
Group II	2	Occurrence probable over a limited time period	Gases, vapours, mist, dust	High safety level 1 protection class For which no more than one error may occur	Gruppe II Zone 1 (gas) Zone 21 (dust)
Group II	3	Occurrence improbable Only for short periods	Gases, vapours, mist, dust	Normal safety level Required protective measures	Group II Zone 2 (gas) Zone 22 (dust)

Safety in hazardous areas

Which explosion protection categories are most commonly used?

- Pressure-resistant encapsulation (Ex d) in compliance with EN60079-1:**

Components that are capable of triggering an explosion are enclosed in a housing that is capable of withstanding the explosion. Openings in the housing are designed to prevent the explosion from being transmitted externally.

- Increased safety (Ex e) in compliance with EN60079-1:**

This explosion protection category is normally applied to transformers, motors, batteries, terminal blocks, electrical lines and cables. It is not suitable for the protection of electronic components and spark-generating components (such as switches, relays or surge protection). Additional measures and an increased safety level are implemented in order to prevent any sparks, electrical arcing or unallowable high temperatures which could trigger ignitions. Increased safety is made possible by housing that prevents dusts from penetrating within.

- Explosion protection methods (Ex n):**

This explosion protection category may only be used in the hazardous areas 2/22. Here there is no danger of an explosion from the electrical equipment during normal operations or during defined malfunctions. This includes all electrical devices and components that have no spark-forming contacts and that have a water-proof or dust-proof housing. Larger creepage and clearance distances are not required as long as the maximum rated voltage of 60 V AC / 70 V DC is maintained.

- Intrinsic safety (Ex i) in compliance with EN60079-11:**

Power supply to electrical equipment is carried out through a safety barrier which functions to limit the current and voltage so that the minimum power and temperature levels for creating an explosive mixture are not reached. Intrinsic safety for electrical and electronic devices is specified so that their circulating or stored power (even in event of malfunction) is never strong enough to trigger an explosion in an explosive atmosphere. You must also remember that not only the electrical device but also all other components connected to the circuit may be exposed to the explosive atmosphere. All switching circuits in intrinsically safe devices must be designed so that they are also intrinsically safe.

These devices are divided into the category groups <ia> and <ib> which differ in the number of occurring malfunctions.

Category <ia>

=> Switching circuits within category <ia> electrical devices must not be able to cause a spark even if two independent malfunctions take place.

Category <ib>

=> Switching circuits in electrical devices must not be able to cause a spark when a malfunction.

Electrical devices for use in explosive gas, vapour and mist atmospheres – in accordance with CENELEC

Explosion protection type	Identification	Protective design
Pressure-resistant encapsulation	Ex d	Encloses the explosion and prevents fire from spreading
Increased safety	Ex e	No spark formation or hot surfaces
Method of explosion protection	Ex n	No spark formation or hot surfaces
Intrinsic safety	Ex i	Limited energy for preventing spark formation or overheated surface temperatures

CENELEC classification of gases, dusts and the maximum permitted surface temperatures of devices and components

Gas group	Temperature classes					
	T1	T2	T3	T4	T5	T6
I	Methane	-	-	-	-	-
IIA	Ammonia Methane Ethane Propane	Ethyl alcohol Cyclohexane n-Butane n-Hexane	Benzene, Kerosene	Acetaldehyde	-	-
IIB	Lighting gases, Acrylonitrile	Ethylene, Ethylene oxide	Ethylene glycol, Hydrogen sulphide	Ethyl ether	-	-
IIC	Hydrogen	Ethine (Acetylen)	-	-	-	Hydrocarbons

IEC (group II) Classification	Max. surface temperature	Comment
T1	450 °C (842 °F)	
T2	300 °C (572 °F)	
T3	200 °C (392 °F)	
T4	135 °C (275 °F)	The temperature is relevant to all parts of the devices that can come into contact with potentially explosive materials.
T5	100 °C (212 °F)	
T6	85 °C (185 °F)	
Tx	Max. surface temperature undefined	Valid for the closed tank systems used on container ships where the individual contents cannot be monitored in event of a fire. It is the responsibility of the operator to assess each temperature class.

What labelling is considered proper?

An example of device labelling:

CE 0539	Ex	II	2	G	Ex ia	IIA	T4
Certification authority ex. DEMKO	European Commission mark for Ex devices	Device group "Surface"	Device category zone 1	Gas	Protection explosion type: intrinsically safe category <ia>	Gas group	Surface temperature: max 135 °C

ATEX directives

Since July 1, 2003, all new facilities in hazardous areas must be certified according to ATEX Directive 94/9/EG or ATEX 95 (ATEX: ATmosphère EXplosive = explosive atmosphere). This directive is one of the "New-Approach" directives. It is valid in all European Union countries, as well as Iceland, Lichtenstein and Norway. In these countries, the directive refers to the sale and commissioning of products which have been designed particularly for high explosion risk environments (where explosive atmospheres exist due to gases, vapours, mists, or dusts). It now also covers the mining sector and purely mechanical devices.

Class of protection

Type of protection	Code	CENELEC EN	IEC	Product category explosion protect.
General requirements	-	60079-0	60079-0	-
Oil immersion	o	60079-6	60079-6	2

Labelling for ATEX approval of a signal converter

II 3 G Ex nAnCnL IIC T4

- II** = Device group 2: devices for use in hazardous areas (except for mines and above-ground mining facilities that are exposed to flammable dusts or methane)
- 3** = Device category 3: the danger occurs rarely or only for short periods. The requirement is for normal security, suitable for use in zone 2.
- G** = Intended for the gas zone
- Ex** = Explosion protection
- nA** = Non-sparking equipment
- nC** = Enclosed facility (suitable protection)
- nL** = Equipment with limited power
- IIC** = Explosion groups: typical gas for C is hydrogen
- T4** = Temperature class: The max. permitted surface temperature for T4 is 135 °C

Zone 2 a zone for which, during normal operations, there is at most, only a short-term occurrence of dangerous hazardous atmospheres (mixtures of air and flammables gases, vapours or mists).

II (1) G [Ex ia] IIC/IIB/IIA

- II** = Device group 2: devices for use in hazardous areas (except for mines and above-ground mining facilities that are exposed to flammable dusts or methane)
- (1)** = Device category (1): Equipment from category 1 can be connected to this signal converter. The signal converter must be operated in the safe zone or in zone 2 (II 3 G ...).
- G** = Intended for the gas zone.
- [Ex ia]** = Explosion protection type: protected with intrinsic safety. This signal converter, as accompanying equipment, is intended to be used for the connection of intrinsically safe circuits.
- IIC/**
- IIB/IIA** = Explosion groups – typical gases: propane for A, Ethylene for B, and hydrogen for C.

II (1) D [Ex iaD]

- II** = Device group 2: devices for use in hazardous areas (except for mines and above-ground mining facilities that are exposed to flammable dusts or methane)
- (1)** = Device category (1): Equipment from category 1 can be connected to this signal converter. The signal converter must be operated in the safe zone or in zone 2 (II 3 G ...).
- D** = Designed for the dust zone.
- [Ex iaD]** = Explosion protection type: protected with intrinsic safety. This signal converter, as accompanying equipment, in intended to be used for the connection of intrinsically safe circuits.

Design of clearance and creepage distances in electrical equipment – influencing factors

Rated impulse withstand voltage

The rated impulse withstand voltage is derived from:

- **Voltage conductor – earth**
(the rated voltage of the network, taking into account all networks)
- **Surge category**

Table 1: Rated impulse withstand voltages for electrical equipment

Rated voltage of power supplies system *) in V		Rated impulse withstand voltage in kV			
		Electrical equipment at the supplies point of the installation (Surge category IV)	Electrical equipment as part of the permanent installation (Surge category III)	Electrical equipment to be connected to the permanent installation (Surge category II)	Specially protected electrical equipment (Surge category I)
Three-phase systems	Single-phase systems with neutral point				
120 to 240		4.00	2.50	1.50	0.80
230/400					
277/480		6.00	4.00	2.50	1.50
400/690		8.00	6.00	4.00	2.50
1000		Values depend on the particular project of, if no values are available, the values of the preceding line apply.			

*) to IEC 38

Surge categories

are stipulated in accordance with the German standard DIN VDE 0110-1 (for electrical equipment fed directly from the low-voltage network).

Surge category I

- Equipment that is intended to be connected to the permanent electrical installation of a building. Measures to limit transient surges to the specific level are taken outside the equipment, either in the permanent installation or between the permanent installation and the equipment.

Surge category II

- Equipment to be connected to the permanent electrical installation of a building, e.g. household appliances, portable tools, etc.

Surge category III

- Equipment that is part of the permanent electrical installation and other equipment where a higher degree of availability is expected, e.g. distribution boards, circuit-breakers, wiring systems (including cables, busbars, junction boxes, switches, power sockets) in the permanent installation, and equipment for industrial use and some other equipment, e.g. stationary motors with permanent connections to the permanent installation.

Surge category IV

- Equipment for use at or near the power supplies in the electrical installations of buildings, between the principal distribution and the mains, e.g. electricity meters, circuit-breakers and centralised ripple controllers.

Pollution severity categories

Pollution severity category 1

- No pollution, or only dry, non-conductive pollution that has no influence.

Pollution severity category 2

- Non-conductive pollution only; occasional condensation may cause temporary conductivity.

Pollution severity category 3

- Conductive pollution, or dry, non-conductive pollution that is liable to be rendered conductive through condensation.

Pollution severity category 4

- Contamination results in constant conductivity, e.g. caused by conductive dust, rain or snow.

Unless explicitly stated otherwise, the measurement of clearance and creepage distances and the resulting rating data for electromechanical components is based on pollution severity 2 and surge category III, taking account of all network types.

Derating curve (current-carrying capacity curve)

The **derating curve** shows which currents may flow continuously and simultaneously via all possible connections when the component is subjected to various ambient temperatures below its upper limit temperature.

The **upper limit temperature** of a component is the rated value determined by the materials used. The total of the ambient temperature plus the temperature rise caused by the current load (power loss at volume resistance) may not exceed the upper limit temperature of the component, otherwise it will be damaged or even completely ruined.

The current-carrying capacity is hence not a constant value, but rather decreases as the component ambient temperature increases. Furthermore, the current-carrying capacity is influenced by the geometry of the component, the number of poles and the conductor(s) connected to it.

The current-carrying capacity is determined empirically according to DIN IEC 60512-3. To do this, the resulting component temperatures t_{b1} , t_{b2} and the ambient temperatures t_{u1} , t_{u2} are measured for three different currents I_1 , I_2 .

The values are entered on a graph with a system of linear coordinates to illustrate the relationships between the currents, the ambient temperatures and the temperature rise in the component.

Base curve

t_b = maximum temperature of component
 t_u = ambient temperature
 I_n = current

Derating curve

t_b = maximum temperature of component
 t_u = ambient temperature
 I_n = current
a = base curve
b = reduced base curve (derating curve)

The **loading currents** are plotted on the y-axis, the **component ambient temperatures** on the x-axis.

A line drawn perpendicular to the x-axis at the upper limit temperature t_b of the component completes the system of coordinates.

The associated average values of the temperature rise in the component, $\Delta t_1 = t_{b1} - t_{u1}$, $\Delta t_2 = t_{b2} - t_{u2}$, are plotted for every current I_1 , I_2 to the left of the perpendicular line. The points generated in this way are joined to form a roughly parabolic curve.

As it is practically impossible to choose components with the maximum permissible volume resistances for the measurements, the base curve must be reduced.

Reducing the currents to 80 % results in the "**derating curve**" in which the maximum permissible volume resistances and the measuring uncertainties in the temperature measurements are taken into account in such a way that they are suitable for practical applications, as experience has shown. If the derating curve exceeds the currents in the low ambient temperature zone, which is given by the current-carrying capacity of the conductor cross-sections to be connected, then the derating curve should be limited to the smaller current in this zone.

IP class of protection to DIN EN 60529

The class of protection is indicated by a code consisting of the two letters IP and two digits representing the class of protection.

Example: **I P 6 5**

2nd digit: protection from liquids

1st digit: protection from solid bod

Protection against intrusion of external particle matter (1st digit)

Glossary

1-9

2-way isolation	The input and output signals are separated electrically from each other and decoupled. Potential differences caused by long wire lengths and common reference points are eliminated.
3-way isolation	Also decouples the power supply to the input and output circuit and enables supply with only one operating voltage.

A

A/D converter	Converts standardised analogue current and voltage signals into an 8-bit, 12-bit or 16-bit digital signal. It may be necessary to convert analogue signals into digital signals when you need the analogue signal from the surroundings to work with the typical digital processing requirements of process monitoring.
AC	Alternating current
Accuracy	Describes the ability of an analogue signal isolating converter to transmit a measured value as precisely as possible. It is specified in the percent deviation from the measuring range end value at room temperature.
Active sensor	In an active sensor, an electrical signal is generated from the measurement itself, for example dynamometric or piezo-electric. Thus no auxiliary power source is required. Because of their physical operating principals (since energy cannot be sent during the static and quasi-static states), only a change in the measured variable can be detected.
Actuator	The actuator is a sensor counterpart – it converts electrical current into another form of energy.
Alarm contact	A switching contact that activates when a disturbance occurs (for example, an overload or short circuit).
Ambient temperature	DIN EN 60204-1 uses this term to refer to the temperature of the surrounding air or medium at which the equipment can be properly and safely operated. This is a part of the surrounding physical and operational conditions. Failure to maintain this temperature level can invalidate the product warranty.
Analogue signal	A signal is designated as an analogue signal if it transmits parameter information that is infinitely variable between a minimum and maximum value (this includes instantaneous values such as current, voltage or temperature). This applies to practically all real-world processes or states. It is theoretically possible to register any small signal changes (there is a very large dynamic range).

W

Glossary**ATEX**

The ATEX directive from 23.4.1994 is valid within the EU and the EFTA Western European nations. It applies to devices, machinery components, controllers and protective systems that are to be used in hazardous areas. This directive harmonises the different national regulations from the EU member nations concerning the proper and intended use of machines and facilities in hazardous areas.

ATEX is derived from the phrase “**A**Tmosphere **E**Xplosive”. It stipulates that operators should prevent explosions and ensure protection.

Regarding explosion protection in a potentially explosive atmosphere, the ATEX directive 94/9/EC has precedence over machinery directives and must be followed. The directive describes the following steps:

- Describe how often a potentially explosive atmosphere occurs and where it occurs.
- These areas are then divided into zones according to the specifications.
- Make sure that only properly categorised equipment is present within each different zone. As soon as an area is classified as being dangerous, steps must be taken to limit the potential ignition sources that are present there.

C

Calibration device	A special instrument used for the calibration and configuration of analogue signal conditioning devices. The calibration device produces highly precise standardised signals. It is equipped with a load indicator for quick loop diagnostics.
CE	Abbreviation for Communauté Européenne (the European Community). Manufacturers use the CE label to confirm that their products comply with the corresponding EC directives and the “essential requirements” therein.
Cold-junction compensation	Thermocouples require a temperature reference point to compensate for unwanted “cold junctions”. The usual method for achieving this is by measuring the temperature at the reference junction with a temperature sensor that can be read immediately. The interfering voltage can then be compensated for in the measurement results. This process is referred to as cold-junction compensation (CJC).
Common-mode interference	Interfering currents and voltages that can occur on the connecting cables between electrical devices and facility components. These can then spread with similar phase and current direction to the feed line and the return line.
Counter	A counter can be used for measuring flow or for counting events. Analogue or digital input signals (pulses) may also be processed. Integrated function such as linearisation, interference suppression, hysteresis configuration and reference values expand the range of use of a counter. Switching contacts are available on the output side for monitoring threshold.

W

Creepage and clearance distances

The safety gaps between two current-carrying wires. The creepage distance is the shortest path along an insulating surface between two live components. The clearance distance is the shortest path in the air between two points of reference.

**D****D/A converter**

D/A converters convert standardised digital signals (for example, with an 8-bit structure) into analogue current and voltage signals. It may be necessary to convert digital signals into analogue signals when you need the analogue signal from the surroundings to work with the typical digital processing requirements of process monitoring.

DC

Direct current

Derating

The continuous current level reduction in relation to an ambient temperature increase, represented as a derating curve (a load reduction curve).

Glossary

Device categories	The device category determines which equipment can be used in which zone. There are six device categories. The categories 1 G, 2 G and 3 G are classifications for gas explosion protection (G = Gas). Equipment with 1 G is suitable for zones 0, 1 and 2. Equipment with 2 G is suitable for zones 1 and 2. Equipment with 3 G is suitable for zone 2. The categories 1 D, 2 D and 3 D are classifications for dust explosion protection (D = Dust). Equipment with 1 D is suitable for zones 20, 21 and 22. Equipment with 2 D is suitable for zones 21 and 22. Equipment with 3 D is suitable for zone 22.
Device groups	Equipment is divided into groups I and II. Group I concerns underground mining while group II concerns explosion protection for gas and dust in all other applications.
DTM	DTMs (Device Type Manager) are software drivers that are vendor- and device-neutral. DTMs define functions for access to device parameters, troubleshooting, configuration and operation of devices. The DTM specifies all device-specific information, functions and rules (such as the device structure, communication capabilities, internal dependencies and the human-machine interface (HMI)). Device manufacturers make available a Device Type Manager (DTM) software driver for each device or device group.

E

EIA-232/ RS232	The term EIA-232 (originally RS232) refers to a serial interface standard developed by a U.S. standards committee (now known as the EIA – Electronic Industries Alliance) in the early 1960s. EIA-232 specifies the connection between the data terminal equipment (DTE) and the modem (data communication equipment or DCE). It defines timing, voltage level, plug and protocol details. EIA-232 defines a voltage interface. The information bits are encoded using electrical voltage. The data lines (TxR and RxT) use a negative logic whereby a voltage level between -3 V and -15 V (ANSI/EIA/TIA-232-F-1997) represents a logical one and a voltage level between +3 V and +15 V represents a logical zero. Signal levels between -3 V and +3 V are undefined.
EIA-422/ RS422	EIA-422 (also known as RS422) is an interface standard for cable-based differential, serial data transmission. In contrast to the asymmetric serial interface specified by the EIA-232 standard, the EIA-422 interface is designed for symmetric transmissions. This means that two sets of twisted pair wires are required to carry the positive and negative signals from the sender to the receiver. This minimises common-mode interferences and also increases the data rates in comparison to the asymmetric EIA-232 interface. EIA-422 can be used to establish a full-duplex, point-to-point connection. Multi-drop networks with one sender and up to ten receivers are also possible. The sender and receiver in multi-drop networks can only be operated in half-duplex (in one direction). Because of the high data rate (up to several MBit/s), a wire pair on the EIA-422 interface must be terminated with a terminating resistor (normally 120 ohm).

W

EIA-485/ RS485	EIA-485, also referred to as RS485, is an interface standard for digital, cable-based, differential, serial data transmissions. EIA-485 uses a wire pair for transmitting inverted and non-inverted levels for a single-bit data signal. The original data signal is reconstructed by the receiver as the difference between the two voltage levels. This has the advantage of increasing the resistance to interference, since common-mode interference then has no effect on the transmission. The EIA-485 interface operates with a voltage differential of +/-200 mV, so that the voltage interface has a differential related to half of the operational voltage. It normally uses a single wire pair and is operated in half-duplex. However full-duplex operations are possible with two wire pairs. This connection has multi-point capabilities; up to 32 nodes can be connected to an EIA-485 bus. Standard cable lengths run up to 1.2 km in length and support transmission speeds up to 10 MBit/s. The wire pairs must be terminated with resistors (typically 120 Ohm) because of the cable length and high data rates.
Electrical equipment	All of the electrical and electronic components and circuits within an enclosure.
Explosion groups	Depending on the ignition protection, explosion-protected equipment intended for gases, vapours and mists are divided into three explosion groups (IIA-IIB-IIC). The explosion group provides a measure of the explosive break-through capability of gases (in an explosive atmosphere). The requirements for the equipment increase in strictness from II A to II C.
Explosion protection types	<p>The ignition protection type is a term used in explosion protection that refers to the various types of protective construction designed into the product. Ignition protection types are formulated to minimise the risk that an ignition source will be present in an explosive atmosphere.</p> <p>The following ignition protection types are specified:</p> <ul style="list-style-type: none"> • For electrical equipment in a gas <ul style="list-style-type: none"> • Intrinsic safety Ex i • Pressure-resistant Ex d encapsulation • Increased safety Ex e • Pressurization encapsulation Ex p • Oil immersion Ex o • Moulded encapsulation Ex m • Sand encapsulation Ex q • Ignition protection type for zone 2 Ex n • Special ignition protection type Ex s • For electrical equipment in dust <ul style="list-style-type: none"> • Pressurization encapsulation Ex pD • Intrinsic safety Ex iD • Moulded encapsulation Ex mD • Protection provided by housing Es tD

Glossary

Explosive atmospheres	This is defined as a mixture of flammable materials and oxygen. An ignition leads to a explosive burning process throughout the entire mixture. Usually the oxygen is supplied by the surrounding air. Flammable materials may be gases, liquids, vapours, mists or dusts. Explosion protection considers this to be normal atmospheric conditions. The explosiveness of the mixture depends of the flammability of the materials and the concentration of air or oxygen.
------------------------------	---

F

Flammability rating	Flammability class specification according to the American UL 94 specification. Duration of burning, annealing time and the burning drop formation are all taken into account. The highest category is V-0.
Frequency converter	Converts frequencies into analogue signals (or vice versa). In-line control systems can then directly process pulse strings from speed or rotational measurements.

G

Galvanic isolation	Potential-free isolation between electrical components. Normally, the inputs circuit, output circuit and power supply are designed so that they are electrically isolated from each other. The isolation can be achieved using optical means (an optocoupler) or by using a transformer. The electrical isolation of measurement signals ensures that the differences in earth potentials and common-mode interference are suppressed
GOST-R	The Russian certification for products, materials and technical facilities.

H

Hall sensor current measurement	Hall sensors can measure the magnetic field of a conducting wire. They then generate a proportional voltage on the measurement output (the Hall voltage). This can be converted to a standardised signal by means of an amplifier circuit. Such a measurement is well suited for measuring high DC and AC currents with frequencies up to 1 kHz. Start-up currents and current peaks cannot damage a Hall sensor.
--	---

W

HART®	<p>HART® (Highway Addressable Remote Transducer) is a communications protocol for bus-addressed field devices used in process automation. In HART®-based communications, field devices and controllers are connected together over 4–20 mA current loops. This analogue signal is superimposed with a digital signal by using the FSK process (Frequency Shift Keying). The process allows additional measurements, configuration and device data to be transmitted without influencing the analogue signal. Ex isolators can also be used in hazardous areas.</p>
Hazardous area	<p>According to the ATEX directive, an hazardous area is where the extent of the explosive atmosphere mandates that extra measures must be taken to safeguard health and protect surrounding machinery. Hazardous areas are classified according to the frequency and duration of the occurrence of the explosive atmosphere (refer to the sub-divided zones).</p>
Hysteresis	<p>Specifies the percent difference between the switch-on and switch-off points of a switching contact. The hysteresis must not fall below a minimal value. Otherwise it would no longer be possible to carry out specific switching during the monitoring of threshold.</p>

IECEx	An international directive regarding the creation of declarations of conformity by the manufacturers of facilities, devices and components that are intended for use in explosion risk zones. This directive is valid throughout the globe but is only currently used in some Asian nations.
Impulse withstand voltage	The high pulse voltage of a specified form and polarity that does not lead to an insulation breakthrough or flashover, under the specific conditions defined in EN 60664-1.

Glossary

Initiator PNP/NPN switched	Two wires in a three-wire sensor are responsible for keeping the supply activated. The third connecting wire is used for transferring commands (NO/NC contact). Initiators with NPN outputs switch the load in active mode towards the minus potential. Proximity switches with PNP outputs switch toward the plus potential.
Insulation voltage	For electronics components with electrical isolation, this is the maximum AC test voltage that can be applied for a specified time interval (5 s / 60 s) without causing a break-through.
Intrinsic safety "i"	Electrical equipment for hazardous areas with the ignition protection type "Intrinsic safety Ex i". Intrinsic safety is divided into ignition protection types "ia" or "ib". The ignition protection type "intrinsic safety" is a protective strategy that requires a complex analysis of electronic devices. So it is not only important to protect intrinsically safe current from the other unsafe circuits. It is also important to limit the open-circuit voltage, short-circuit current, power, stored energy and the surface temperature of components that will be exposed to the explosive atmosphere. Intrinsically safe circuits are circuits where a spark or thermal effect (as may occur under the testing conditions specified by EN 60079-11) is not capable of igniting an explosive atmosphere (of sub-groups IIA, IIB or IIC) or a dust-air mixture. The testing conditions cover normal operations and certain error conditions as specified in the standard.
IP protection classes	Equipment is assigned an IP protection class to indicate which environmental conditions it can be used in.
Isolation amplifier (active isolator)	An isolation amplifier is used to provide electrical isolation for analogue standard signals. They are designed with 2-way or 3-way isolation. The isolation of the potentials eliminates interference on the measurement signal that can be caused by earth loops or common-mode noise. The active isolator makes use of a separate voltage source for its power supply. It functions without feedback; a change on the output side load does not influence the input circuit.

L

Leakage current	The current on the load side of an optocoupler that flows towards the output circuit while in a closed state.
Limiting frequency	The limiting frequency of an analogue signal isolating converter is that frequency where the output signal is reduced to $1/\sqrt{2}$ of the value of the input signal (approx. 70.7 % = -3 dB).
Line break monitoring	Analogue measuring transducer with wire-break detection capability that permanently monitors the input signal. In the event of a fault (a wire break), the output signal jumps up to a defined value over the nominal range so that a controller wired further down the circuit can evaluate the error.

W

Linearisation	Temperature-dependent components normally do not have a linear characteristic curve. Their characteristic curves must be linearised so that they can be evaluated as precisely as possible. The measurement curves of thermocouples and temperature-dependent resistors (NTC/ PTC), in particular, exhibit significant deviation from an "ideal curve". In the linearisation process, the measurement signal is processed by a microprocessor and an ideal characteristic curve is generated which can then be analysed or processed further.
Load cell	A load cell is a special type of force sensor used in weighing systems (i.e., with scales). They are calibrated in grams (g), kilograms (kg) or tons (t). Load cells usually have a spring mechanism used as a force sensor. The spring is a specially shaped piece of metal whose shape changes slightly when under the influence of weight. This elastic deformation is recorded by strain gauges and converted into an electrical signal. Weights can be recorded ranging from a few hundred grams to several thousand tons.
Load resistance (load)	This is the load resistance on the output side of a measuring transducer or transmitter. For analogue current outputs, the load is 500–600 ohms maximum. Voltage outputs normally have a load of at least 10 kOhm.

M

Measurement isolating transformer	Converts electric and non-electric input signals into standard analogue signals. At the same time it provides electrical isolation between the input and output (2-way isolation) or between the input, output and supply (3-way isolation). Measurement isolators are typically used to record temperatures (RTD, thermocouples) or for measuring current, voltage, power, frequency, resistance and conductivity.
Measuring bridge	Sensors based on Wheatstone bridge circuitry can capture force, pressure and torque. Relatively small length changes under 10 – 4 mm can be recorded using DMS strain gauges in the form of resistance changes. A typical application is for capturing measurements in load cells.

N

Namur sensor	NAMUR-compliant sensors (The standardization commission for measuring and control technology in the German chemical industry) operate with a load-independent current. They have four modes so that an analogue evaluative unit can detect a sensor malfunction. 1) Current of 0 mA => wire break, circuit is open 2) Current of approx. 20 % of the max. value => Sensor ready, activated 3) Current of approx. 60 % of the max. value => Sensor ready, not activated 4) Current at max. value => short circuit, max. current NAMUR sensors are suited for use in hazardous areas.
NEC 500 – 505	The relevant directives for the classification of explosion protection in the USA. NEC 500 regulates the standard Ex classifications (class – division – model). The NEC 505 defines the zone model based on the European and IEC classifications.

Glossary

Nominal switching current – load side	The permitted load current of a relay contact or semiconductor contact when in continuous operations.
Nominal switching voltage – load side	The switching voltage that a relay contact or semiconductor contact uses in relation to its application.

O

Output-current loop-powered	Output loop powered 2-wire transmitters have a 4 – 20 mA output. The transmitter is supplied with power via the current loop on the output side. A typical loop consists of a regulated DC power supply, the 2-wire transmitter and a receiving device.
Overvoltage category	<p>The overvoltage categories are described in DIN EN 60664-1. The category dictates the insulation clearance gaps required. Category III is the default specification (EN 50178).</p> <ul style="list-style-type: none"> • Overvoltage category I Devices that are intended to be connected to the permanent electrical building installation. The measures for limiting transient surge voltages to the proper level are taken outside of the device. The protective mechanisms can either be in the permanent installation or between the permanent installation and the device. • Overvoltage category II Devices that are intended to be connected to the permanent electrical building installation (such household appliances or portable tools). • Overvoltage category III Devices that are a part of the permanent installation and other devices where a higher degree of availability is required. This includes the distributor panels, power switches, distribution systems (including cable, busbars, distributor boxes, switches and outlets) that are part of the permanent installation, devices intended for industrial use, and devices that are continually connected to the permanent installation (such as stationary motors). • Overvoltage category IV Devices that are intended to be used on or near the power feed in a building's electrical installation – ranging from the main distribution to the mains power system. This includes electrical meters, surge protection switches and ripple control equipment.

W

P

Passive isolator/ input loop powered	Generates its power supply from the input signal (0/4–20 mA). The amount of current needed internally is so small that the measurement signal is not influenced. Transformers are used to provide the isolation between the input and the output. The advantages include: eliminates the influence of the mains power system, highly accurate, minimal signal delay, and minimal power used. Passive isolators do not function free from feedback; so a load change on the output circuit will automatically effect the input circuit as well.
Passive sensor	Contains passive components whose parameters can be changed by the measured variables. A primary electronic mechanism converts these parameters into electric signals. An auxiliary external power source is needed for the passive sensor. Passive sensors can be used to determine both static and semi-static measured variables. For this reason, the majority of sensors have a passive construction. Examples of this type include load cells and resistance thermometers.
Pollution severity level	The pollution severity level specifies the conditions of the immediate surroundings. It is defined in DIN EN 50178, Section 5.2.15.2. The pollution (contamination) severity level should be used to determine the required creepage distance for the insulation. Pollution degree 2 is the default specification. <ul style="list-style-type: none"> • Pollution severity level 1 There is no contamination or only dry occurrences of non-conductive pollution. This pollution has no influence. • Pollution severity level 2 There is only non-conductive pollution. Temporary occurrences of conductivity caused by condensation may also occur. • Pollution severity level 3 Conductive pollution or dry, non-conductive pollution that can become conductive due to condensation is likely to occur. • Pollution severity level 4 The contamination leads to continual conductivity which can be caused by such contaminants as conductive dust, rain or snow.

R

Rated voltage	Specified by the insulation coordination – the rated voltage is the voltage level at which the product can be safely operated, in relation to the corresponding pollution severity level and the surge voltage category.
Relative humidity	The relationship between the actual moisture and the maximum possible quantity of water in the air. Expressed as a percentage.

W

Glossary

RoHS	The EC directive 2002/95/EC – concerning the restriction of the use of certain hazardous substances in electrical and electronic equipment – regulates the use of hazardous materials within devices and components. This directive, and its various implementations into national laws, are referred to by the abbreviation RoHS (Restriction of Hazardous Substances).
RTD/ PT100/ 1000	<p>RTD sensors are temperature probes that operate based on the resistance changes which take in metal as the temperature changes. They are resistance thermometers based on PTC resistors. The electrical changes in resistance of a platinum wire or platinum film is often used for measuring temperatures ranging from -200 °C to 850 °C. The platinum temperature sensors are characterised by their nominal resistance R₀ at a temperature of 0 °C. The standard types include:</p> <ul style="list-style-type: none"> • PT100 (R₀= 100 Ohm) • PT1000 (R₀= 1 kOhm) <p>A two-wire, three-wire or four-wire electrical connection can be used to electrically connect the PT/RTD sensor to the evaluative electronics. A three-wire or four-wire method eliminates any errors caused by the inherent resistance of the sensor connecting wires.</p> <p>In the three-wire method, one end is equipped with two pigtail connectors. In the four-wire method, both ends are equipped with two pigtail connectors.</p>

S	
Self-heating	Self-heating refers to the temperature increase in an operating device caused by the internal power loss.
Sensor	A sensor is a physical component capable of capturing certain physical or chemical properties (such as thermal radiation, temperature, humidity, pressure, noise, brightness or acceleration) as a measurement. It may also be able to analyse the quality of the composition of the material surroundings. These values are captured using physical or chemical phenomena and then converted into another form (usually electrical signals) so they can be post-processed.
Signal distributorsplitter	A signal isolator that accepts an analogue input signal and delivers at least two signals on the output side. This permits the signal to be transmitted to a PLC/ DCS system and to a separate display. A signal multiplier is designed either as an active isolator with an external power feed or as an output loop powered version.
SIL	Safety Integrity Level. The components must meet the requirements of IEC 61508 in order to reduce risk. This standard provides general requirements for avoiding and minimising device and equipment outages. It stipulates organization and technical requirements concerning device development and operation. Four safety levels are defined (from SIL1 for minimal risk to SIL4 for very high risk) for classifying facilities and risk-reduction measures. Risk-reduction measures must be more reliable when the classified risk level is higher.
Status indicator	An LED that displays the operational status, such as operational (yellow), switching (green), and alarm/malfunction (red).
Step response time	This is the time delay in the output signal change when there is a signal jump ranging from 10 to 90 % on the input side. The step response time is inversely proportional to the limiting frequency
Storage temperature	The permitted ambient temperature, related to a specific relative humidity level, for which the product should be stored while in a current-free state.

Switching threshold	The switch-on or switch-off point.
----------------------------	------------------------------------

T																																					
Temperature classes	<p>Explosion-protected equipment that is to be installed into the Ex zone is subdivided into six temperature classes (T1 to T6). These temperature classes define the maximum surface temperature permitted for the equipment. The definition is based on an ambient temperature of +40 °C. This temperature may not be exceeded on any part of the equipment at any point in time. In all cases, the maximum surface temperature must be lower than the ignition temperature of the surrounding medium. The requirements placed on the equipment become stricter from class T1 to T6.</p>																																				
Temperature coefficient	<p>The temperature coefficient describes the relative change of a physical variable based on the temperature change relative to a reference temperature (room temperature). It directly influences the precision of an analogue signal converter. The coefficient is specified in ppm/K of the corresponding measuring range end value.</p>																																				
Thermocouple	<p>A thermocouple is a component made of two different materials which are connected to each other at one end. An electrical voltage is created (based on the principle of the Seebeck effect) along a wire that connects the unattached ends when there is a temperature differential. The juncture point and the unattached ends must have different temperatures for a voltage to be generated.</p> <p>The following thermocouples are used for industrial applications:</p> <table border="1"> <thead> <tr> <th>Thermal pair</th> <th>Short name</th> <th>Type</th> <th>Temperature range in °C</th> </tr> </thead> <tbody> <tr> <td>Nickel/Chrome-Nickel/Al</td> <td>NiCr-Ni/Al</td> <td>K</td> <td>-200 ... +1372</td> </tr> <tr> <td>Iron-constantan</td> <td>Fe-CuNi</td> <td>J</td> <td>-200 ... +1200</td> </tr> <tr> <td>Copper-constantan</td> <td>Cu-CuNi</td> <td>T</td> <td>-200 ... +400</td> </tr> <tr> <td>Nickel/Chrome constantan</td> <td>NiCr-CuNi</td> <td>E</td> <td>-200 ... +1000</td> </tr> <tr> <td>Platinum/10 % Rhodium-Platinum</td> <td>Pt10Rh-Pt</td> <td>S</td> <td>-50 ... +1760</td> </tr> <tr> <td>Platinum/13 % Rhodium-Platinum</td> <td>Pt13Rh-Pt</td> <td>R</td> <td>-50 ... +1760</td> </tr> <tr> <td>Nickel/Chrome-Nickel/Magnesium</td> <td>NiCr-NiMg</td> <td>N</td> <td>-200 ... +1300</td> </tr> <tr> <td>Platinum/30 % Rhodium - Platinum/6 % Rhodium</td> <td>Pt30Rh - Pt6Rh</td> <td>B</td> <td>0 ... +1820</td> </tr> </tbody> </table>	Thermal pair	Short name	Type	Temperature range in °C	Nickel/Chrome-Nickel/Al	NiCr-Ni/Al	K	-200 ... +1372	Iron-constantan	Fe-CuNi	J	-200 ... +1200	Copper-constantan	Cu-CuNi	T	-200 ... +400	Nickel/Chrome constantan	NiCr-CuNi	E	-200 ... +1000	Platinum/10 % Rhodium-Platinum	Pt10Rh-Pt	S	-50 ... +1760	Platinum/13 % Rhodium-Platinum	Pt13Rh-Pt	R	-50 ... +1760	Nickel/Chrome-Nickel/Magnesium	NiCr-NiMg	N	-200 ... +1300	Platinum/30 % Rhodium - Platinum/6 % Rhodium	Pt30Rh - Pt6Rh	B	0 ... +1820

Glossary

Threshold monitoring	The limiting values of physical variables must be continually monitored for industrial processes. This includes fill levels, temperatures, speed, positions, weights and frequencies. Specialised threshold monitoring components are used for this purpose. The sensor signals are captured on the input side, evaluated electronically and converted. The corresponding threshold (min/max) are then made available via the digital switching outputs (relays or transistors) to the external devices. Potentiometers can be used to customise each switching point and its minimum/maximum threshold as well as the switching hysteresis.
Transformer-based current measurement	Signal converters with transformer coupling are used for taking cost-effective measurements of sinusoidal currents (50/60 Hz). The current being measured flows directly through the primary coil of the measurement transformer. It is then stepped down and electronically processed in the converter.
True RMS value	True RMS is the measure of the active component of alternating current and voltages. The root mean square (RMS) is a measure of the magnitude of varying quantities (such as alternating current and voltage). It is a constant value that relates to the power consumed by a resistive load in a specified time period. The RMS is dependent on the amplitude and the curve slope. Non-sinusoidal signals can only be measured and processed with "true RMS"-compliant devices.
TTY	The TTY interface is a serial interface. This interface is often referred to as a 20-mA-current interface since a constant DC current of 20 mA flows through it during the idle state. In contrast to RS232, the data transmission for the asymmetric signal connection is not controlled by voltage changes but by a load-independent line current (typically 20 mA for High and 0 mA for Low). Thus there is no significant length-dependent voltage loss to take into consideration. Here the cable lengths can run up to several kilometres. TTY interfaces are currently used mostly where dedicated connections are required: for exchanging data between electronic scales, for large industrial displays, or for log printers.
Type of contact	A contact is called normally open (NO) or a make contact if it is open when the armature is dropped out (no current in coil) and closed when the armature is picked up (current flowing in coil). A contact is called a break contact or normally closed (NC) contact if it interrupts the circuit when the armature is picked up. A combination of NC and NO is called a changeover (CO) contact. A relay may have one or more of such contacts: NC – Normally Closed = break contact (11, 12: NC contact) NO – Normally Open = make contact (13, 14: NO contact) CO – Change Over contact (11, 12, 14: CO contact (11 is the shared (root) contact))

Z**Zone division**

Hazardous areas are divided into zones. These divisions take into account the various risks from explosive atmospheres. The corresponding explosion protection can then be implemented economically and safely in accordance with the particular conditions of the zone. The zone definitions in the ATEX directive provide comprehensive regulations for the European Community.

IEC 60079-10 is valid for gases and vapours. A similar classification is used for facilities in the USA which are covered by the US standard NEC 505.

IEC 61241-3 covers the division into zones according to the dust level.

Explosion risk areas are classified into zones according to likelihood of explosive atmospheres occurring and their persistence:

Zone 0: this zone has an explosive atmosphere that is a mixture of air and flammable gases, vapours or mists. The mixture is present frequently or over long periods.

Zone 1: an explosive atmosphere may occasionally occur in this zone under normal operating conditions.

Zone 2: an explosive atmosphere is not likely to occur in this zone or may only occur briefly.

Zone 20: this zone has an explosive atmosphere that is a flammable mixture of air and dust. The mixture is present often or over long periods.

Zone 21: an explosive atmosphere, in the form of a flammable dust/air mixture, may occasionally occur in this zone under normal operating conditions.

Zone 22: an explosive atmosphere, in the form of a flammable dust/air mixture, is not likely to occur in this zone or may only occur briefly.

X

All orders are based on our general terms of delivery, which can be reviewed on the websites of our group companies where you place your order. On demand we can also send the general terms of delivery to you.

Weidmüller – Your partner in Industrial Connectivity

As experienced experts we support our customers and partners around the world with products, solutions and services in the industrial environment of power, signal and data. We are at home in their industries and markets and know the technological challenges of tomorrow. We are therefore continuously developing innovative, sustainable and useful solutions for their individual needs. Together we set standards in Industrial Connectivity.
